## Why care about the Hubble constant?

Adam Riess (2019): “ $H_0$  is the ultimate end-to-end test for  $\Lambda$ CDM”

- The  $H_0$  tension is more than just a **tension between CMB and the SHOES** measurement
- Its also a tension between the **inverse distance ladder and high-z measurements**
- We are very far from a solution!

Riess, A. Nat. Rev. Phys. 2 (2020) 10

Why do we need modifications  
to standard cosmology?

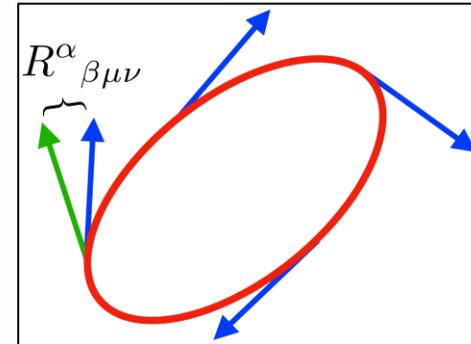

---

# General Relativity and Concordance Cosmology

Einstein-Hilbert action for GR:

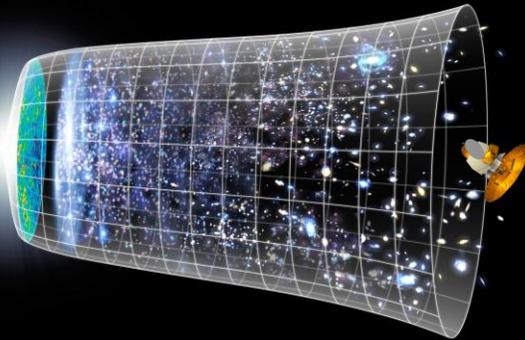

$$S = \frac{1}{16\pi G} \int d^4x \sqrt{-g} [\mathcal{R}] + \int d^4x \sqrt{-g} \mathcal{L}_m(g_{\mu\nu}, \psi)$$

Einstein 1915: **General Relativity (GR)**  
**Energy-momentum** source of curvature  
**Levi-Civita connection**: Zero Torsion, Metricity

**Standard model of particle physics:**  
 $SU(3) \times SU(2) \times U(1)$

Expansion over cosmic history

# Early Universe Concordance Cosmology

## Anomalies and problems:

- The Lithium problem
- Hints of a closed Universe
- Large angular scale anomalies in the CMB
- Anomalously strong ISW effect
- Cosmic dipoles (cosmological principle)
- Lyman- $\alpha$  forest BAO anomalies
- Cosmic birefringence
- Discordance in dark matter abundance at smaller scales

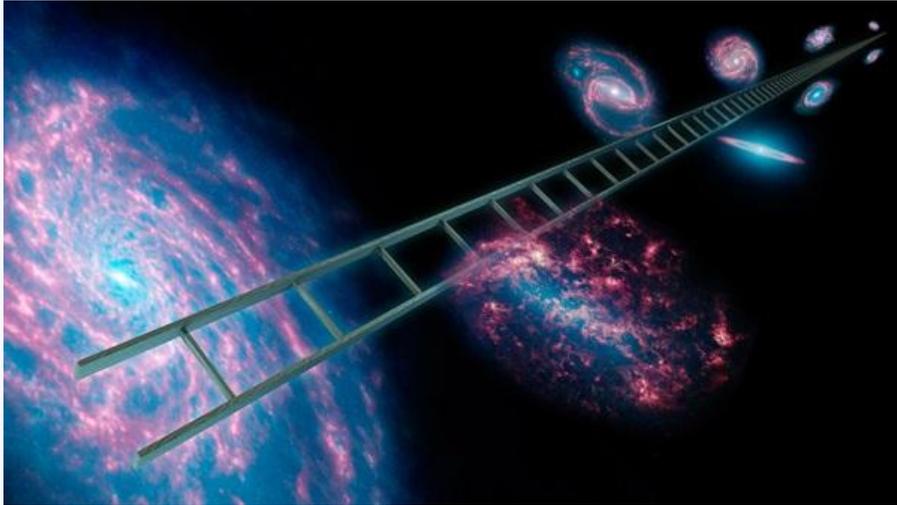

## Cosmic inflation

**Pros:** Horizon and flatness problems

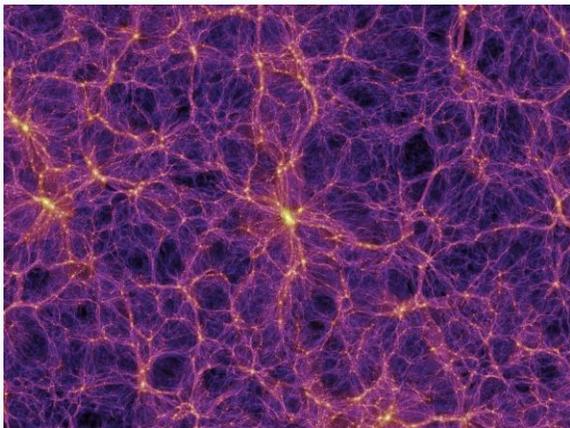

**Cons:** Fine-tuning

# Late Universe Concordance Cosmology

## Anomalies and problems:

- Cold dark matter problems (core-cusp, missing satellites, satellite plane alignment)
- Dark energy in fundamental physics
- Oscillations of best-fit parameters across the sky
- Baryonic Tully-Fisher Relation

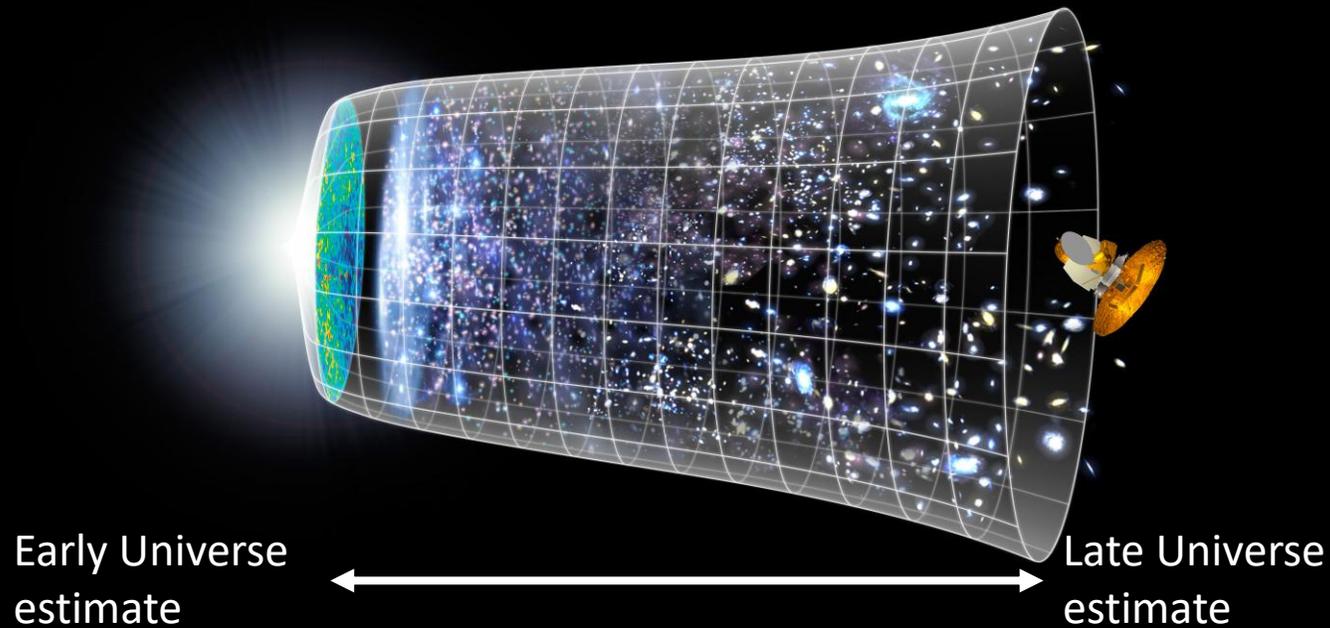

## Requirements:

Dark matter  
Dark energy

$$S = \frac{1}{16\pi G} \int d^4x \sqrt{-g} [\mathcal{R} - 2\Lambda] + \int d^4x \sqrt{-g} \mathcal{L}_m(g_{\mu\nu}, \psi)$$

# The Hubble Tension

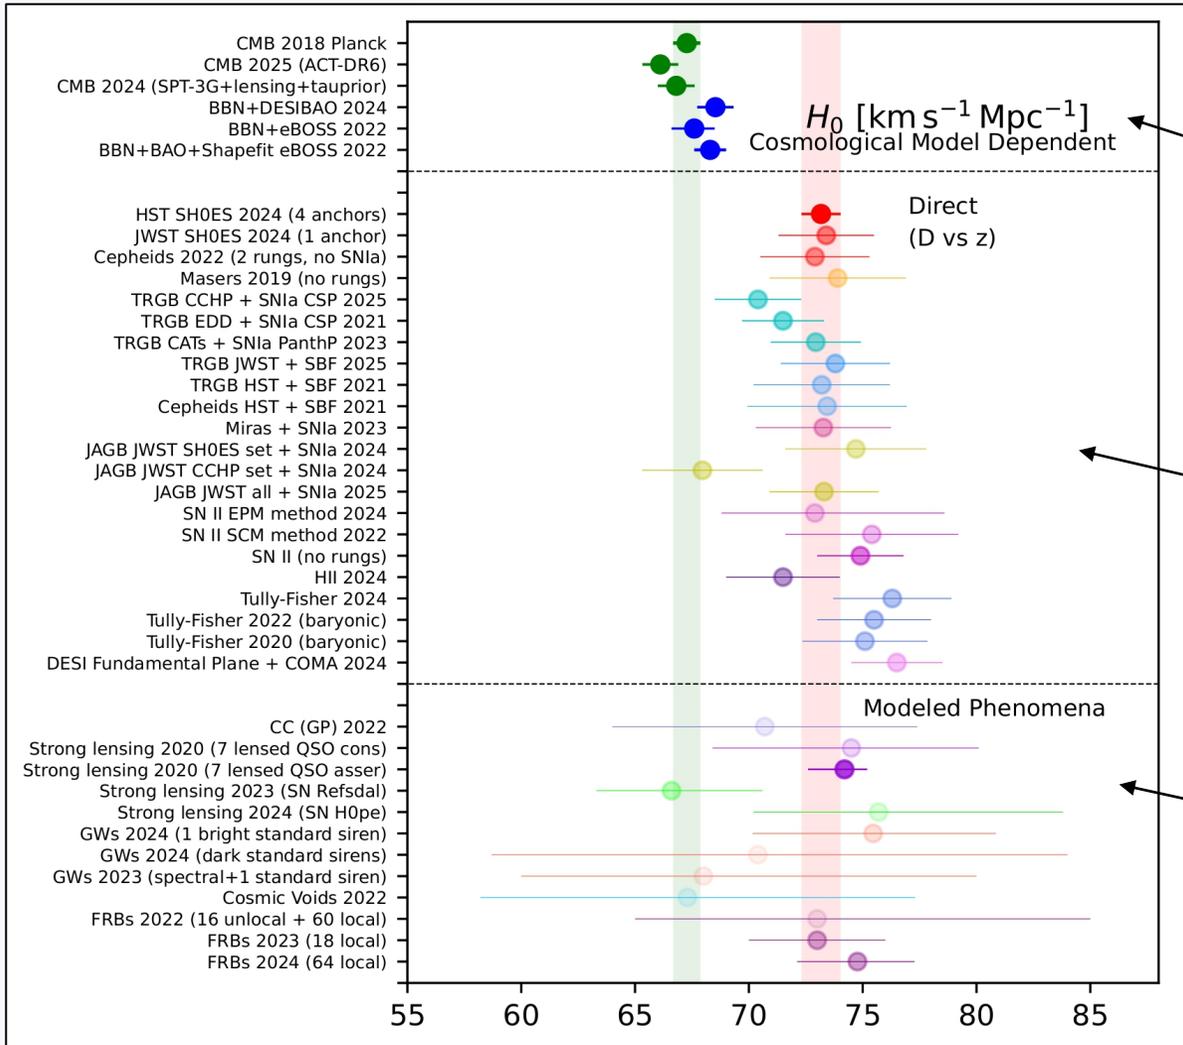

**Cosmic Tension  $> 5\sigma$**

$$H_0^{\text{P}18} = 67.27 \pm 0.60 \text{ km s}^{-1} \text{ Mpc}^{-1}$$

$$H_0^{\text{S}22} = 73.04 \pm 1.04 \text{ km s}^{-1} \text{ Mpc}^{-1}$$

# Cosmic Tensions

Indirect measures predict  $H_0$  using  $\Lambda$ CDM

$$r_s = \int_{z_{\text{LS}}}^{\infty} \frac{c_s(z', \rho_b)}{H(z')} dz'$$

Direct measures estimate  $H_0$  using astrophysics

$$d_L(z) = (1 + z) \int_0^z \frac{dz'}{H(z')}$$

Indirect measures predict  $H_0$  using statistical or astrophysical modeling

## The $H_0$ Olympics:

1. What tension does a model have with the SHOES result using a baseline Planck 2018 + BAO + Pantheon best fit?
2. How does the inclusion of the SHOES measurement impact this fit?
3. Does this inclusion make the best fit better than  $\Lambda\text{CDM}$  or worse?

Schöneberg, N. et al. Phys. Rept., 984 (2022) 1

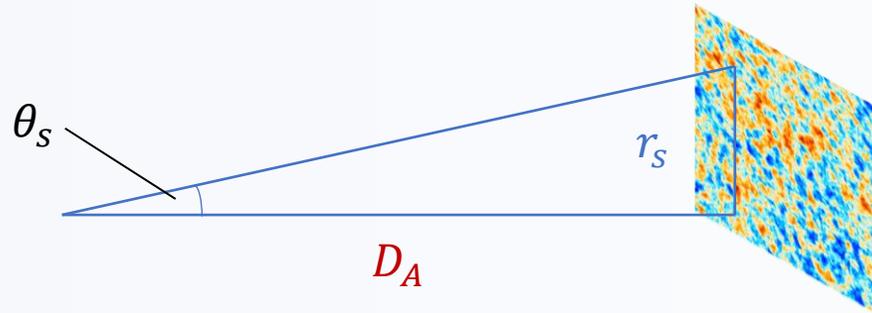

# Status of Potential Solutions

How do mature cosmological models perform in the context of the Hubble tension?

CosmoVerse White Paper. arXiv:2504.01669

# Early vs local measurement approaches

## Early-Universe new physics ( $r_s$ )

- Considering the angular size of the sound horizon

$$\theta_s \sim \frac{r_s}{1/H(z_{\text{late}})} \sim r_s H_0$$

By decreasing  $r_s$ , we can increase  $H_0$ , or so one would expect

## Late-Universe new physics ( $D_A$ )

- Keep early Hubble evolution unchanged and modify late-time evolution of  $H(z)$

This is very difficult to do provided BAO, S<sub>nl</sub>a and CC data

$$\theta_s = \frac{r_s(z_{\text{LS}})}{D_A(z_{\text{LS}})} = \frac{\int_{z_{\text{LS}}}^{\infty} c_s(z, \rho_b) H^{-1}(z') dz'}{\int_0^{z_{\text{LS}}} H^{-1}(z') dz'}$$

# Late-Universe new physics

---

Possible late-Universe solutions with new physics (that give high  $H_0$  values with CMB):

- Graduated Dark Energy Akarsu, Ö., Barrow, J. D., Escamilla, L. A., and Vazquez, J. A. 2020
- Late-time interacting dark sector Gariazzo, S., Di Valentino, E., Mena, O., and Nunes, R. C. 2022
- Decaying dark matter Vattis, K., Koushiappas, S. M., Loeb, A 2020
- Decaying dark energy Li, X., Shafieloo, A., Sahni, V., and Starobinsky, A. A. 2019
- Negative dark energy density Poulin V., Boddy, K. K., Bird, S., and Kamionkowski, M 2018
- Phenomenologically Emergent Dark Energy Li, X., and Shafieloo, A. 2020
- Running vacuum models Sola J., Gomez-Valent, A., and de Cruz Perez, J. 2017

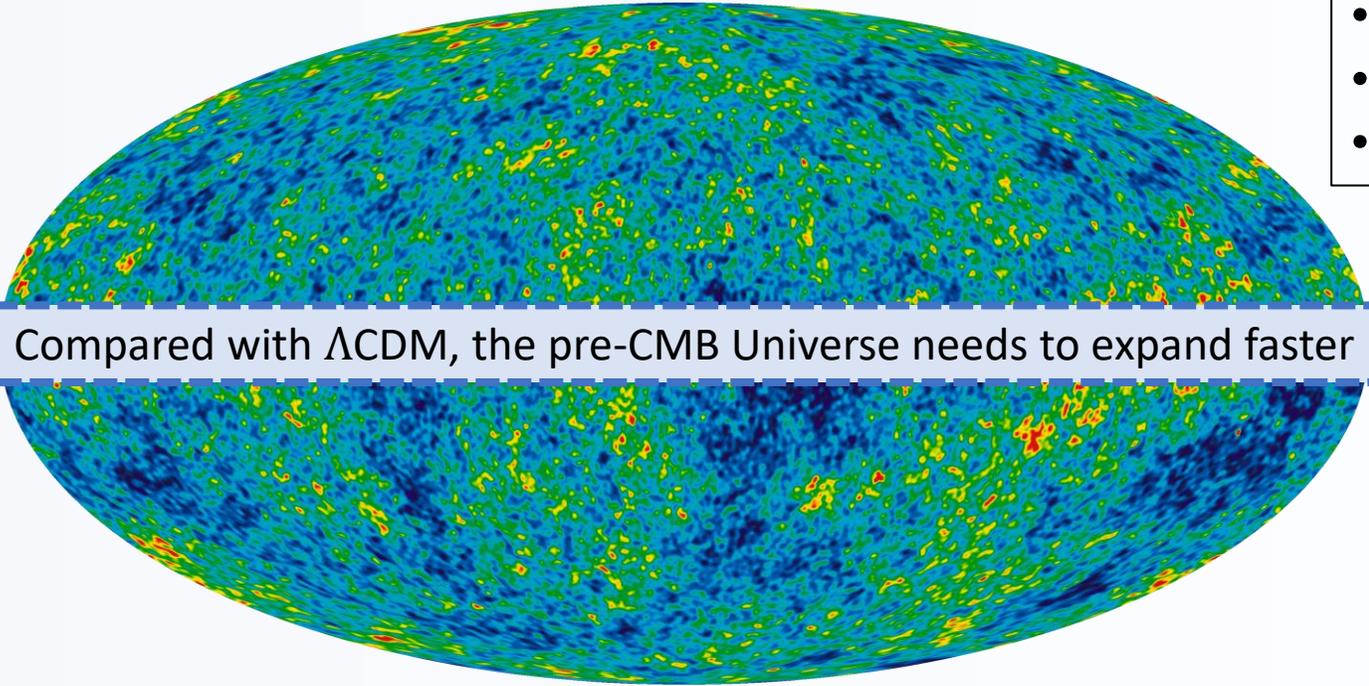

BAO constrain  $\theta_s \sim r_s H_0$ , anchoring  $r_s$  (early Universe) leaves few options for inferring  $H_0$

# Early-Universe new physics

## Early-Universe physics concept:

- Fix  $\theta_s$  (CMB peaks unchanged) so that  $r_s \sim 1/H_0$
- Lower  $r_s$  which will increase pre-CMB expansion rate
- Do not change  $D_A \propto 1/H_{\text{Late}}(z)$ , so modifications in the late Universe are not needed

- Recombination takes place sooner
- Sound waves travel a shorter distance (small  $r_s$ )
- The early Universe cools faster

Compared with  $\Lambda$ CDM, the pre-CMB Universe needs to expand faster

# Early Universe Dark Energy (EDE)

- **Motivation:** Decrease the sound horizon by an early Universe dark component that is active up to roughly matter-radiation equality

- EDE continuity equation implies energy evolution

$$\rho_{\text{EDE}}(a) = \rho_{\text{EDE},0} e^{3 \int_a^1 [1+w_{\text{EDE}}(a)] da/a}$$

This defines the **EDE density parameter**  $f_{\text{EDE}} = \rho_{\text{EDE}}/\rho_{\text{crit}}$

- This can be parametrized through the EoS

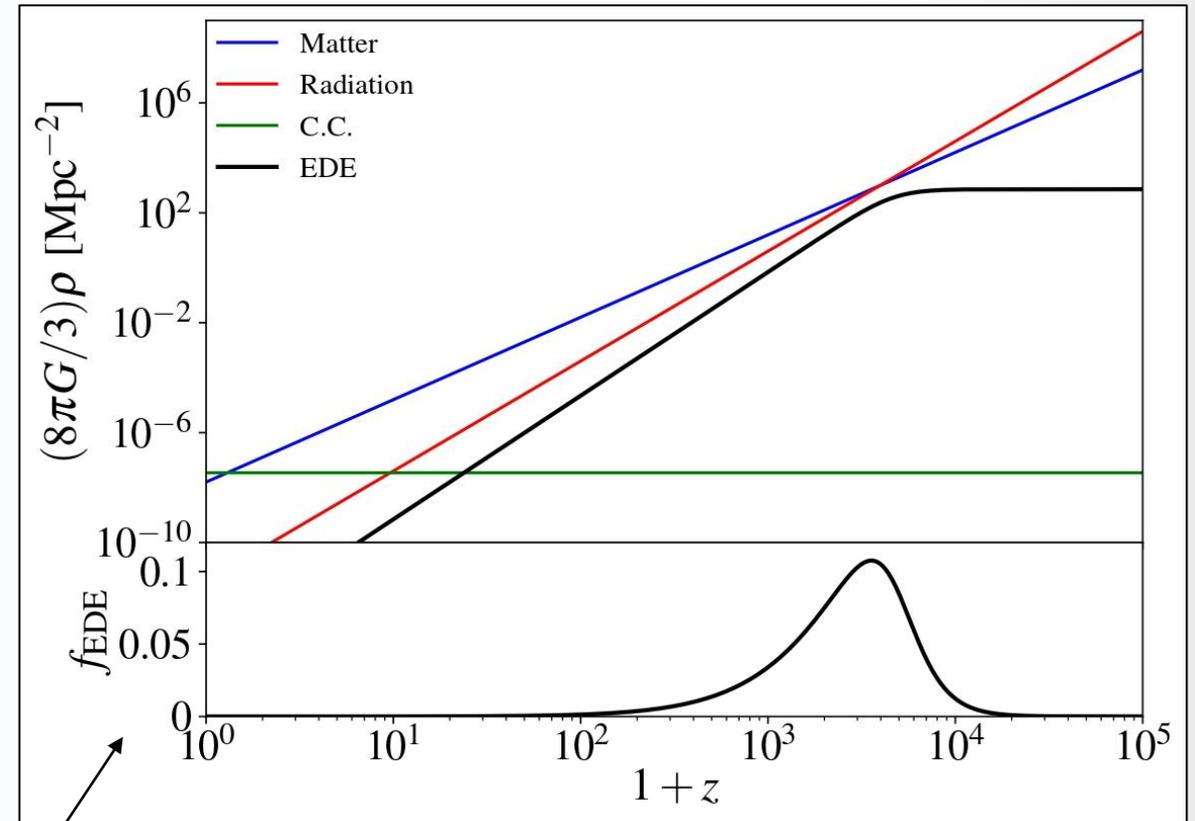

$$w_{\text{EDE}}(a) = \frac{1 + w_f}{1 + (a_c/a)^{3(1+w_f)}} - 1$$

- The **critical scale factor** sets the scale for EDE:

$a \ll a_c \rightarrow$  cosmic expansion with  $w_{\text{EDE}} \rightarrow -1$

$a \gg a_c \rightarrow$  Dilutes as  $a^{-3(1+w_f)}$

Example:  $V(\phi) = \phi^{2n} \Rightarrow w_f = (n - 1)/(n + 1)$

Representative example:  $f_{\text{EDE,max}} = 0.1$  at  $z_c \approx 3500$   
 ( $w_{\text{EDE}} \rightarrow 1/2$  afterwards)

Poulin, V., Smith, T. L., and Karwal, T. arXiv:2302.09032

# EDE Models

- **Axion-like EDE (axEDE):**

$$V = m^2 f^2 \left[ 1 - \cos\left(\frac{\phi}{f}\right) \right]^n$$

- **Rock 'n Roll EDE (RnR EDE):**

$$V = V_0 \left( \frac{\phi}{M_{\text{Pl}}} \right)^{2n} + V_\Lambda$$

- **Acoustic EDE (ADE):**

$$1 + w_{\text{ADE}} = \frac{1 + w_f}{\left[ 1 + (a_c/a)^{3(1+w_f)/p} \right]^p}$$

- **New EDE (NEDE):**

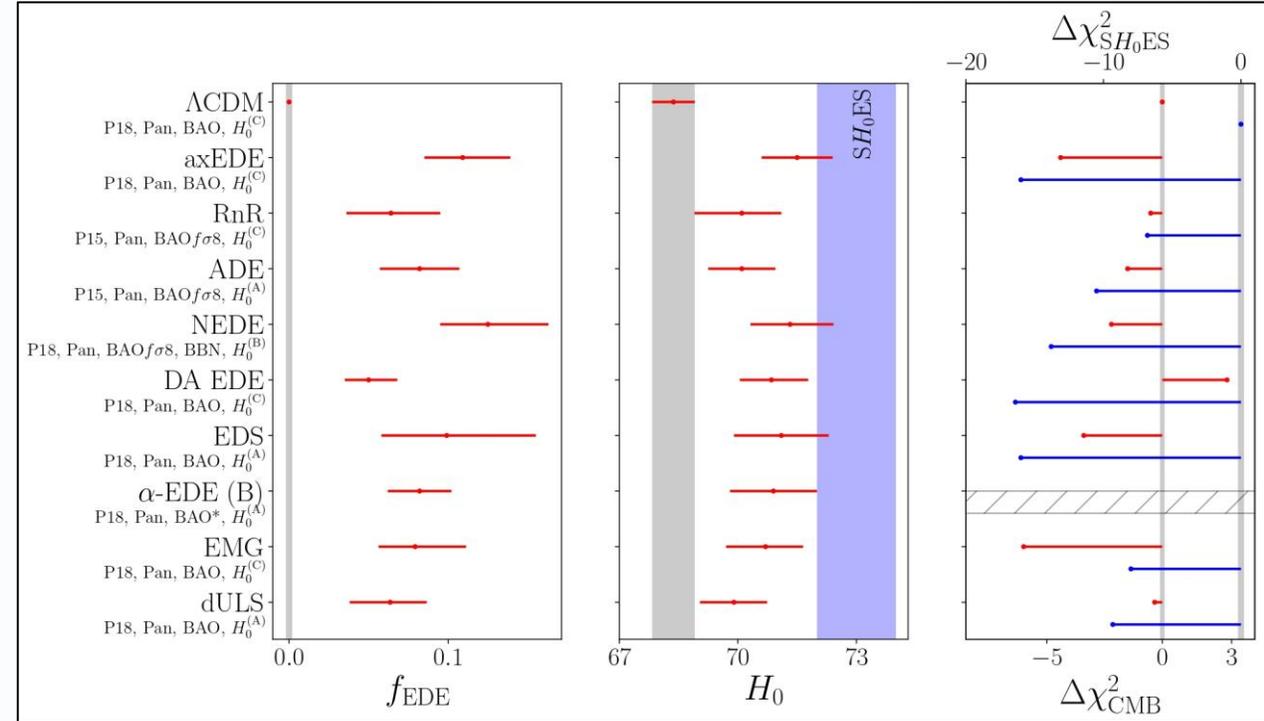

$$V(\psi, \phi) = \frac{\lambda}{4} \psi^4 + \frac{1}{2} \beta M^2 \psi^2 - \frac{1}{3} \alpha M \psi^3 + \frac{1}{2} m^2 \phi^2 + \frac{1}{2} \gamma \phi^2 \psi^2$$

- **EDE coupled to DM (EDS):**

$$V(\phi, a) = V(\phi) + \rho_{\text{DM}}(a)$$

- **$\alpha$  – attractors EDE ( $\alpha$  – EDE):**

$$V = \Lambda + V_0 \frac{(1 + \beta)^{2n} \tanh(\phi/\sqrt{6\alpha}M_{\text{Pl}})^{2p}}{\left[ 1 + \beta \tanh(\phi/\sqrt{6\alpha}M_{\text{Pl}}) \right]^{2n}}$$

Klein-Gordon equation of motion:

$$\ddot{\phi} + 3H\dot{\phi} + \frac{dV(\phi)}{d\phi} = 0$$

$\Delta\chi^2_{\text{SH0ES}}$   
 $\Delta\chi^2_{\text{CMB}}$

# Evolution of EDE

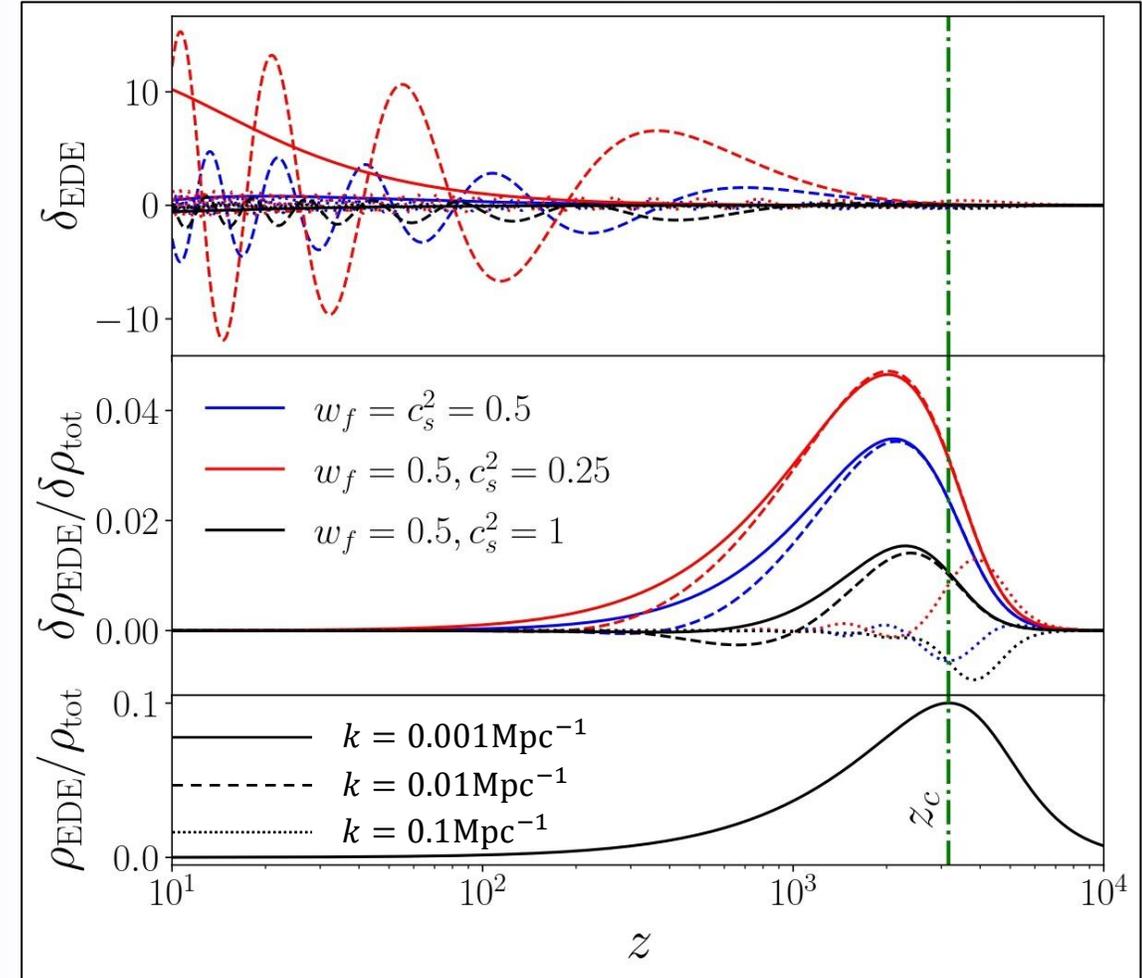

On **subhorizon scales**, the fluid equation takes the form

$$\frac{d^2}{d\eta^2} \left( \frac{\delta_{\text{EDE}}}{1 + w_{\text{EDE}}} \right) = -k^2 \left( c_s^2 \frac{\delta_{\text{EDE}}}{1 + w_{\text{EDE}}} + \psi_{\text{N}} \right) - (1 - 3c_a^2) \frac{a'}{a} \frac{d}{d\eta} \left( \frac{\delta_{\text{EDE}}}{1 + w_{\text{EDE}}} \right)$$

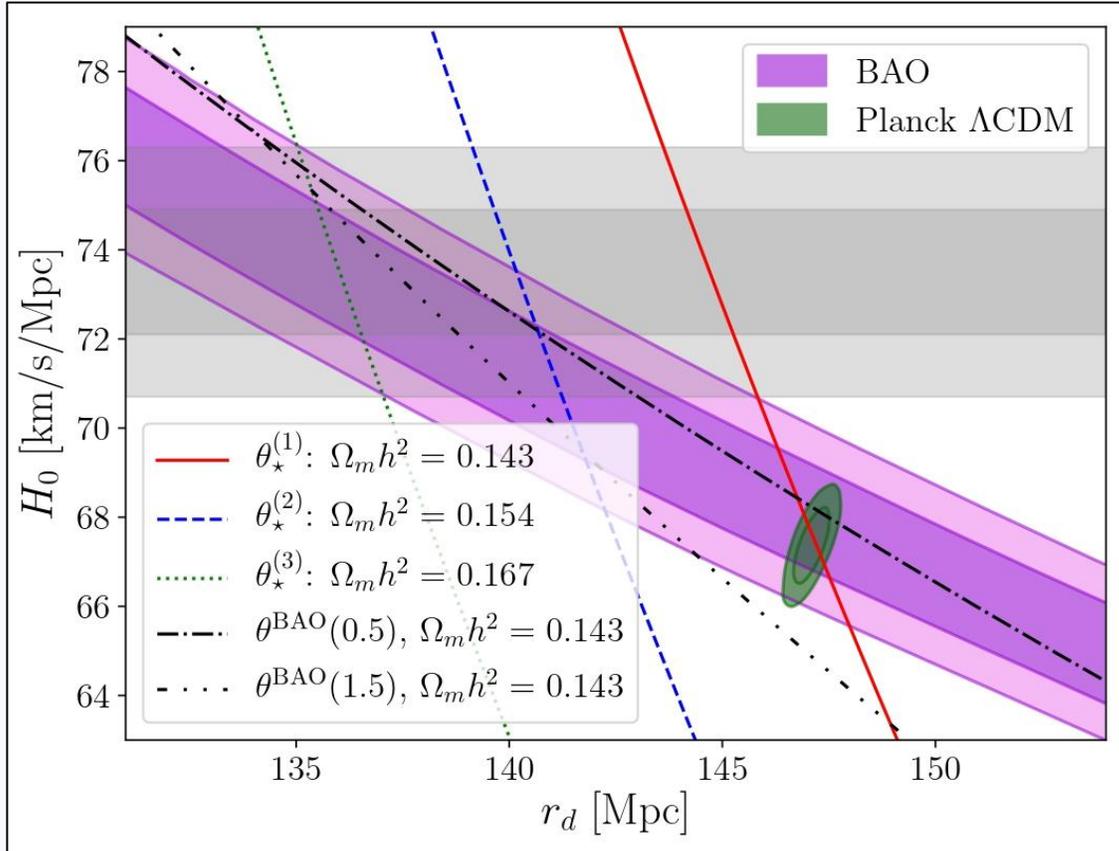

for the fractional EDE perturbation ( $\delta_{\text{EDE}}$ ), effective EDE sound speed ( $c_s^2$ ), Newtonian potential ( $\psi_{\text{N}}$ ) and adiabatic EDE sound speed ( $c_a^2$ )

## General features:

- Larger  $c_s^2$  translates to more resistance in EDE collapse, while smaller  $c_s^2$  give larger overall density perturbations. This sets the frequency of the oscillations
- The sign of  $(1 - 3c_a^2)$  controls where the amplitude increases (+) or decreases (-)
- EDE modes are counteracted by pressure within the horizon, with stable modes only entering the horizon at  $w_{\text{EDE}} \simeq -1$

# The Problem with EDE

Jedamzik, K., Pogosian, L. and Zhao, G. B. Commun. Phys. 4 (2021) 123

CMB angular size at recombination:

$$\theta_* = \frac{r_s(z_{LS})}{D(z_{LS})}$$

Transverse BAO angular scale:

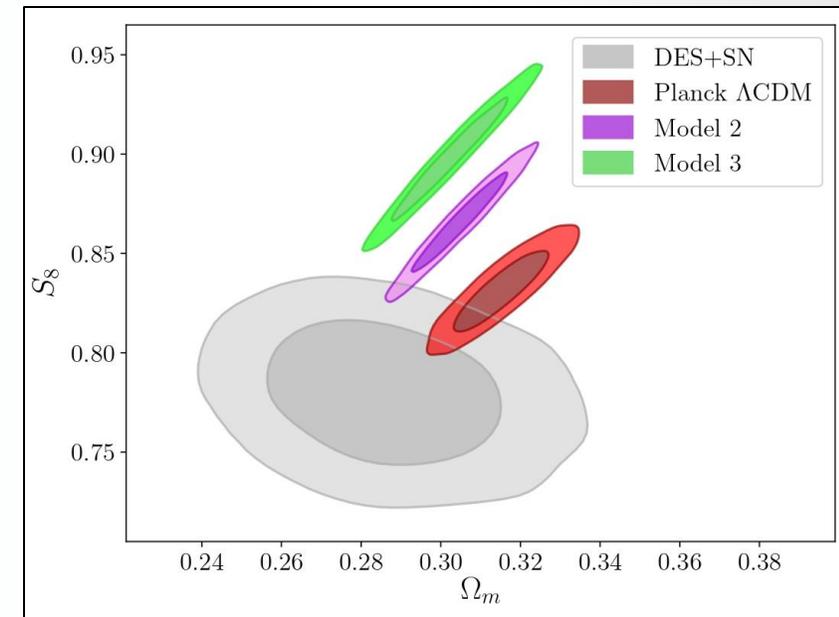

$$\theta^{\text{BAO}}(z_{\text{Obs}}) = \frac{r_d}{D(z_{\text{Obs}})}$$

**Model 2:**

Fits BAO and CMB peaks at  $\Omega_m h^2 = 0.155$

**Model 3:**

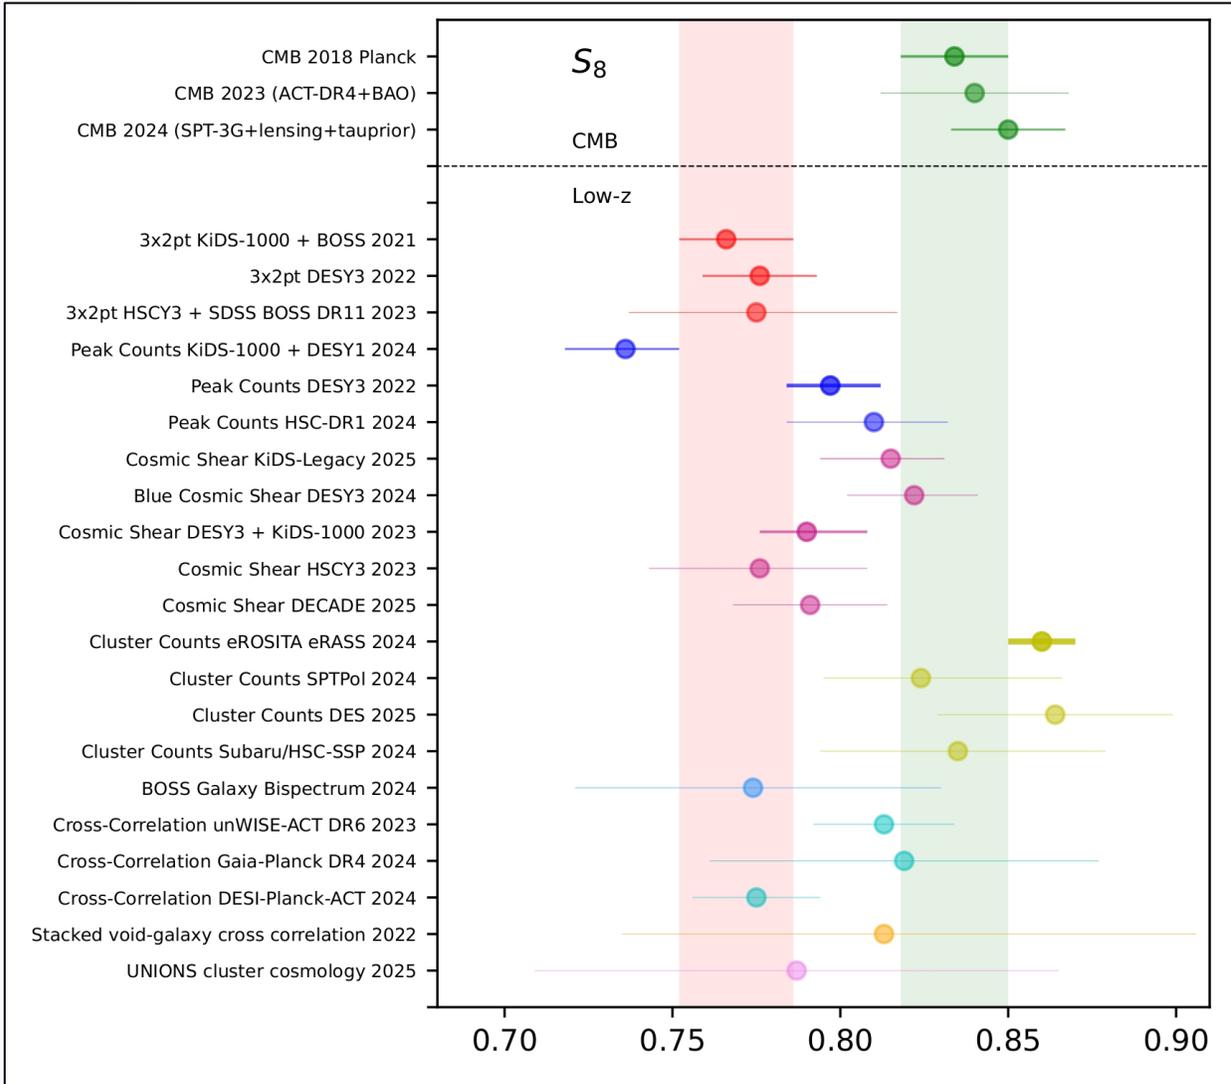

Fits BAO, CMB peaks and SHOES result at  $\Omega_m h^2 = 0.167$

What about other tensions  
on the rise?

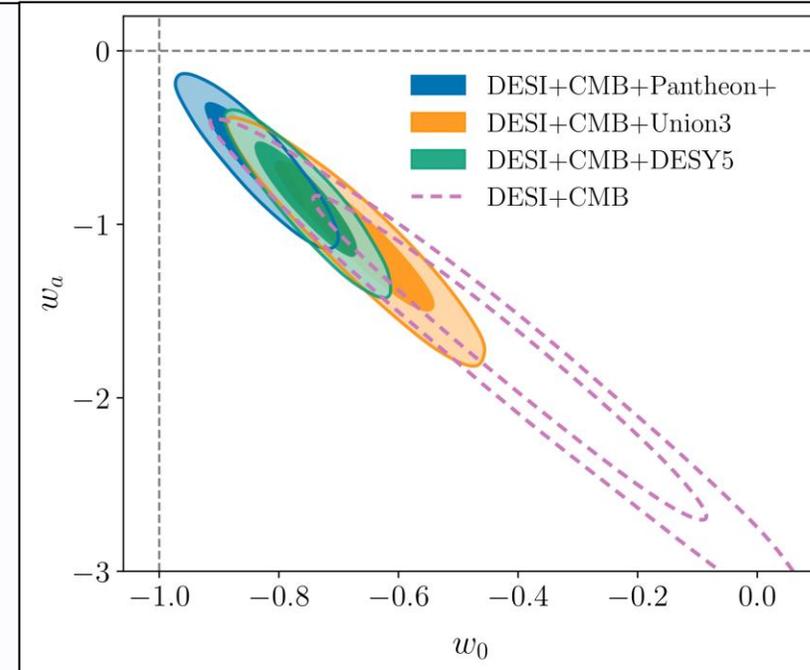

---

# $S_8$ Tension

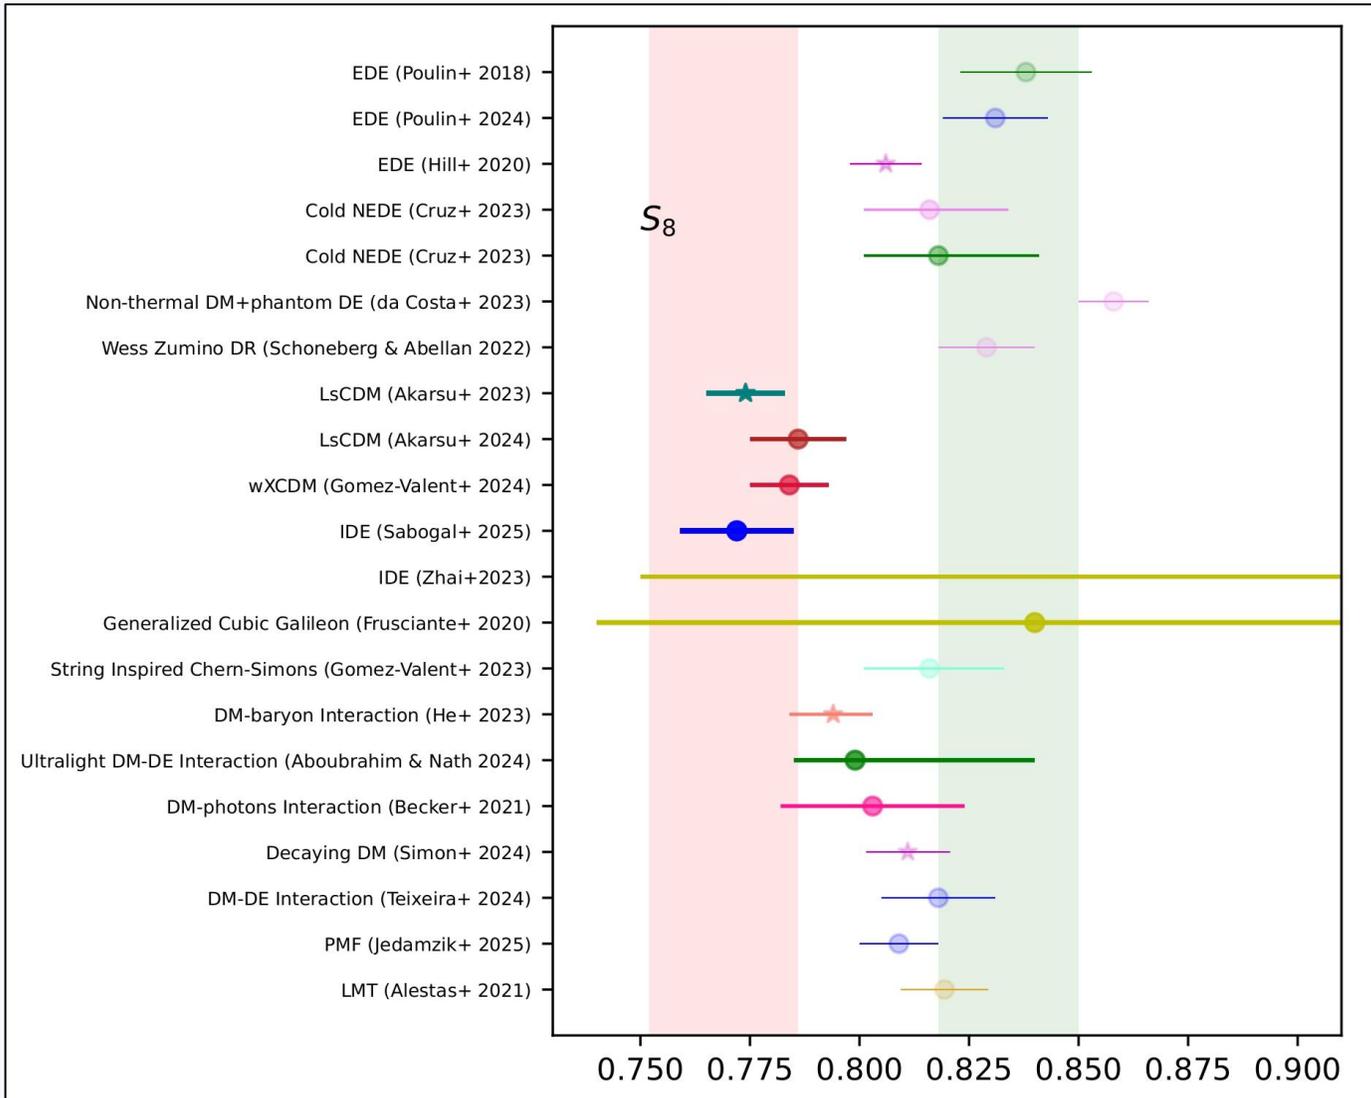

Large scale structure is well represented by  $S_8$  which combines the matter density and matter density fluctuations on the scale of  $8 h^{-1} \text{Mpc}$

$$S_{8,0} = \sigma_{8,0} \sqrt{\frac{\Omega_{m,0}}{0.3}}$$

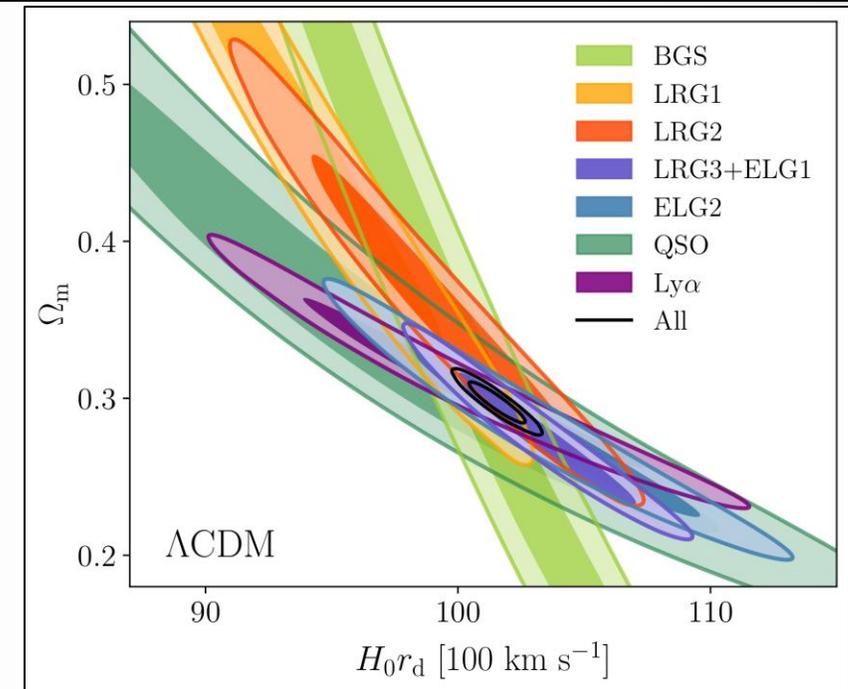

DESI Collaboration,  
arXiv:2503.14738 (2025)

# Status of Potential Solutions

How do mature cosmological models perform in the context of the Hubble tension?

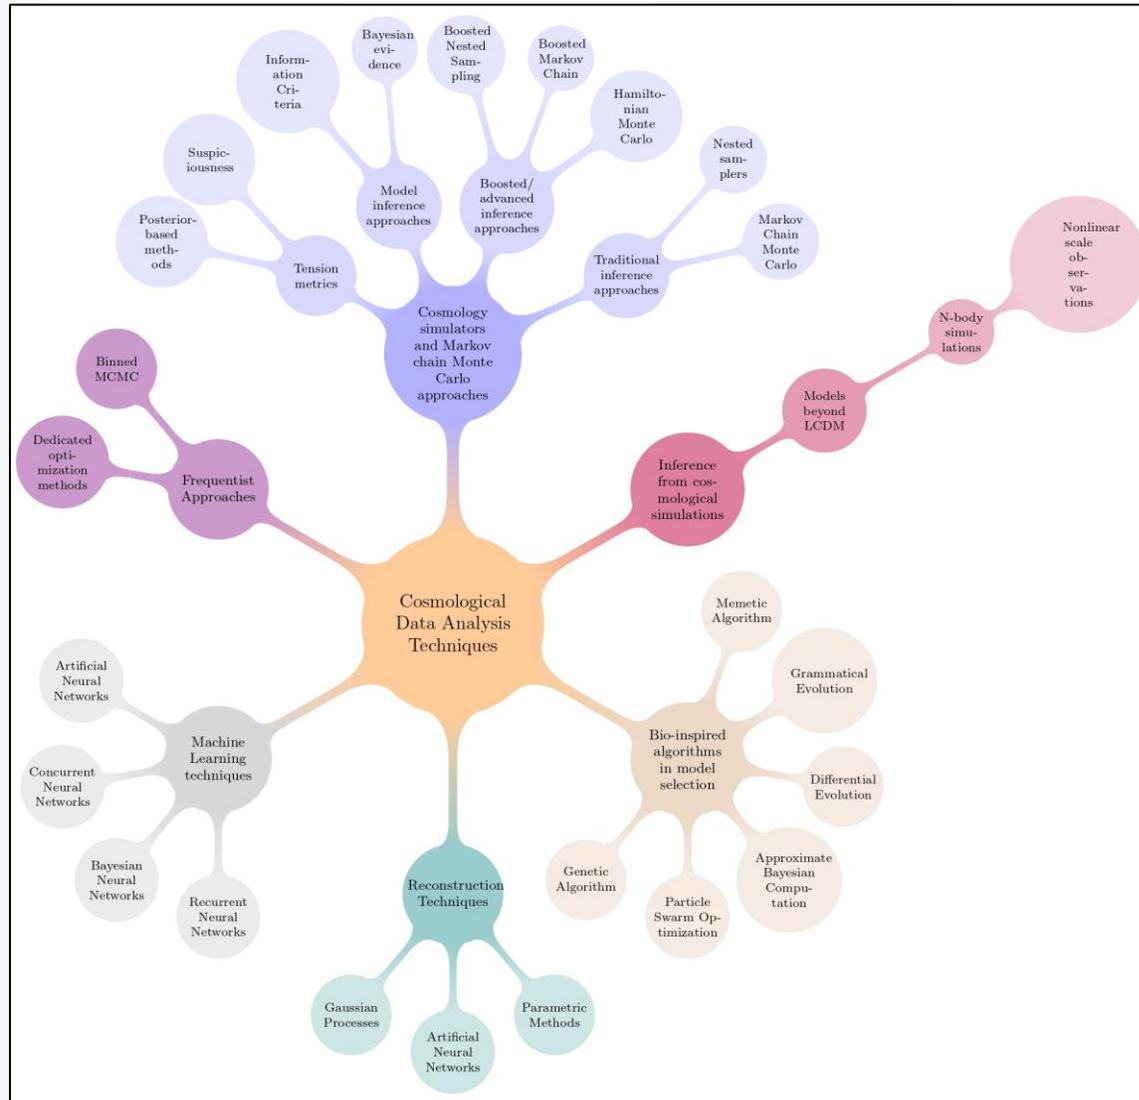

CosmoVerse White Paper. arXiv:2504.01669

DESI Collaboration,  
arXiv:2503.14738 (2025)

How can machine learning  
help?

---

# Data Analysis Techniques

# Gaussian Processes Regression

---

- The covariance function contains **non-physical hyperparameters**  $\theta$  which define the distribution  $k(\theta, x, x')$
- Iterating over these values using **Bayesian inference** (or others) can produce better hyperparameters
- The result is a (physics) **model independent reconstruction** of the behavior of some parameter
- This is superior to regular fitting because it is nonparametric and so **assumes no physical model** whatsoever

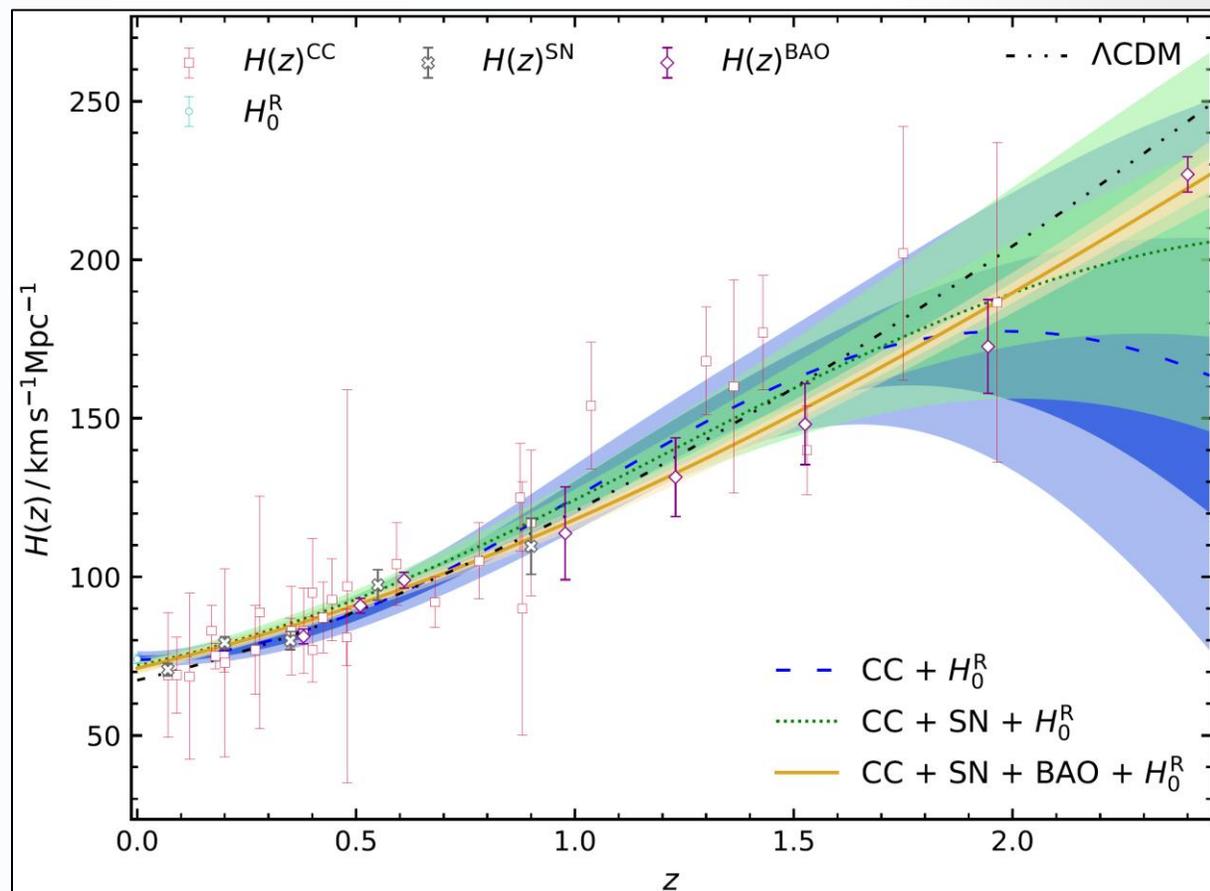

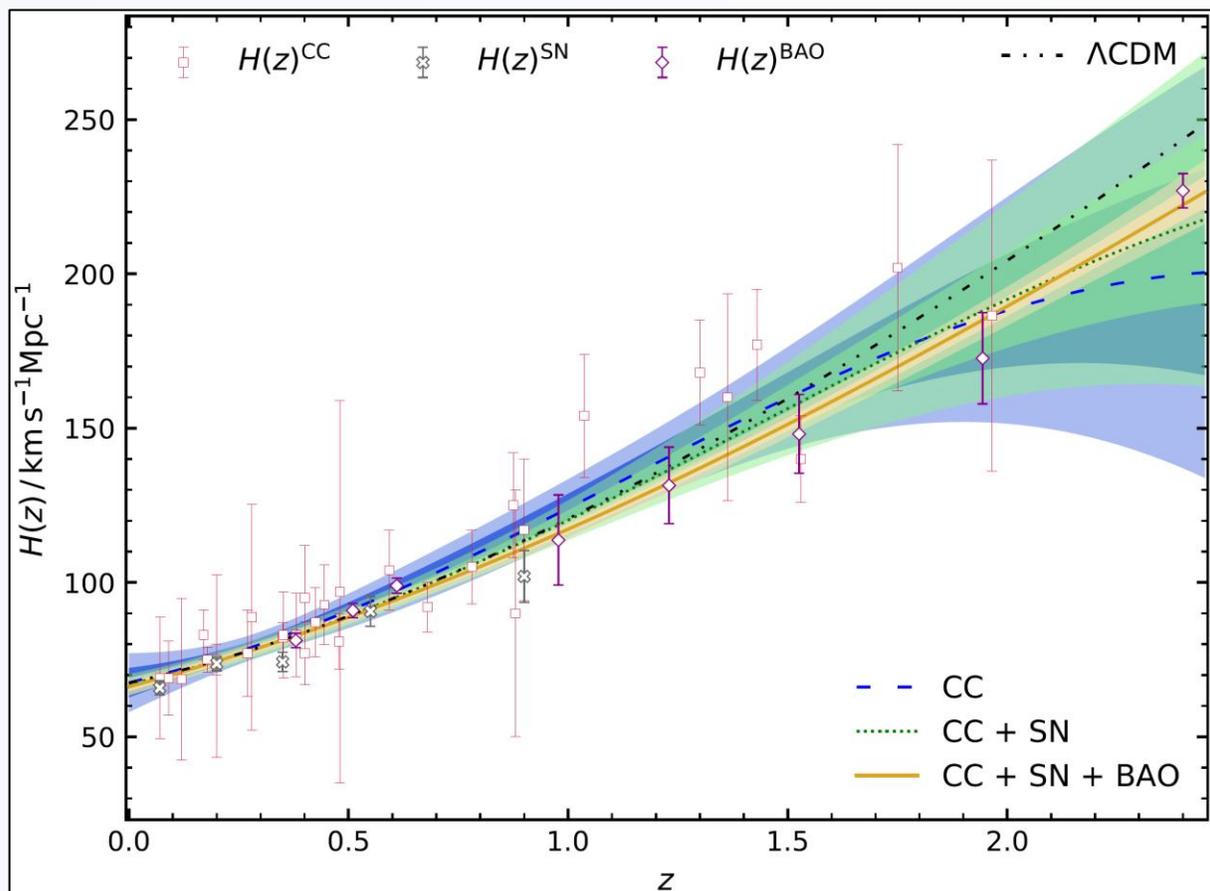

# The Covariance Functions

---

Squared Exponential (Gaussian or RBF):

$$k(x, x') = \sigma_f^2 \text{Exp} \left[ -\frac{1}{2} \left( \frac{x - x'}{l_f} \right)^2 \right]$$

# Square Exponential $H_0$ GP

$$H_0 = 67.539 \pm 4.772 \text{ km s}^{-1} \text{ Mpc}^{-1}$$

$$H_0 = 67.001 \pm 1.653 \text{ km s}^{-1} \text{ Mpc}^{-1}$$

$$H_0 = 66.197 \pm 1.464 \text{ km s}^{-1} \text{ Mpc}^{-1}$$

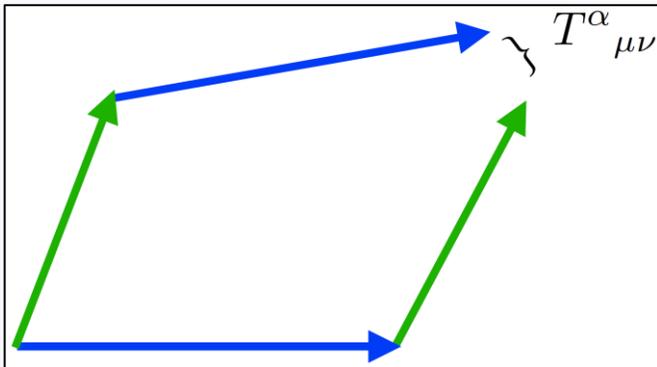

$$H_0 = 73.782 \pm 1.374 \text{ km s}^{-1} \text{ Mpc}^{-1}$$

$$H_0 = 72.022 \pm 1.076 \text{ km s}^{-1} \text{ Mpc}^{-1}$$

$$H_0 = 71.180 \pm 1.025 \text{ km s}^{-1} \text{ Mpc}^{-1}$$

# Toy Model: $f(T)$ Teleparallel Gravity

- Tetrad ( $e^a{}_\mu$ ): Relate the tangent space ( $g_{\mu\nu} = \eta_{ab}e^a{}_\mu e^b{}_\nu$ )
- Use the **teleparallel connection** ( $\Gamma_{\mu\nu}^\sigma = e_a{}^\sigma \partial_\nu e^a{}_\mu + e_a{}^\sigma \omega^a{}_{\nu\mu}$ ) instead of the **Levi-Civita connection** gives  $\mathcal{R} = -T + B$
- **$f(T)$  Gravity**:  $S = \frac{1}{16\pi G} \int d^4x e[-T + f(T)] + S_{\text{mat}}$
- Taking a flat (**FLRW**) cosmology:  $g_{\mu\nu} = \text{diag}(-1, a(t)^2, a(t)^2, a(t)^2)$
- **Friedmann equations:**

$$H^2 = \frac{8\pi G}{3} \rho_m - \frac{f(T)}{6} + \frac{T}{3} f_T$$

$$\dot{H} = -\frac{4\pi G(\rho_m + p_m)}{1 - f_T - 2T f_{TT}}$$

$$T = 6H^2 = 6 \left( \frac{\dot{a}}{a} \right)^2$$

Bahamonde et al. RoPP 86 (2023) 026901

# Boundary Conditions

$\Lambda$ CDM (or  $f(T) = \Lambda$ ) works at late cosmological times

This implies that

$$f_T(z \simeq 0) \simeq 0$$

$$\Rightarrow f(z \simeq 0) = 6H_0^2(\Omega_{m_0} - 1)$$

Briffa et al. CQG 38 055007 (2020)

$$S = \frac{1}{16\pi G} \int d^4x e[-T + \mathbf{f}(T)] + S_{\text{matter}}$$

# Propagating $f(T(z))$

- The Friedmann equation contains  $f_T$  which **need to be eliminated** finite difference methods
- Using a **central differencing** approach (error  $\sim \mathcal{O}(\Delta z^2)$ ), we can assume

$$f'(z_i) \simeq \frac{f(z_{i+1}) - f(z_{i-1}))}{z_{i+1} - z_{i-1}}$$

- Therefore, we can remove the  $f_T(T) = f'(z)/T'(z)$

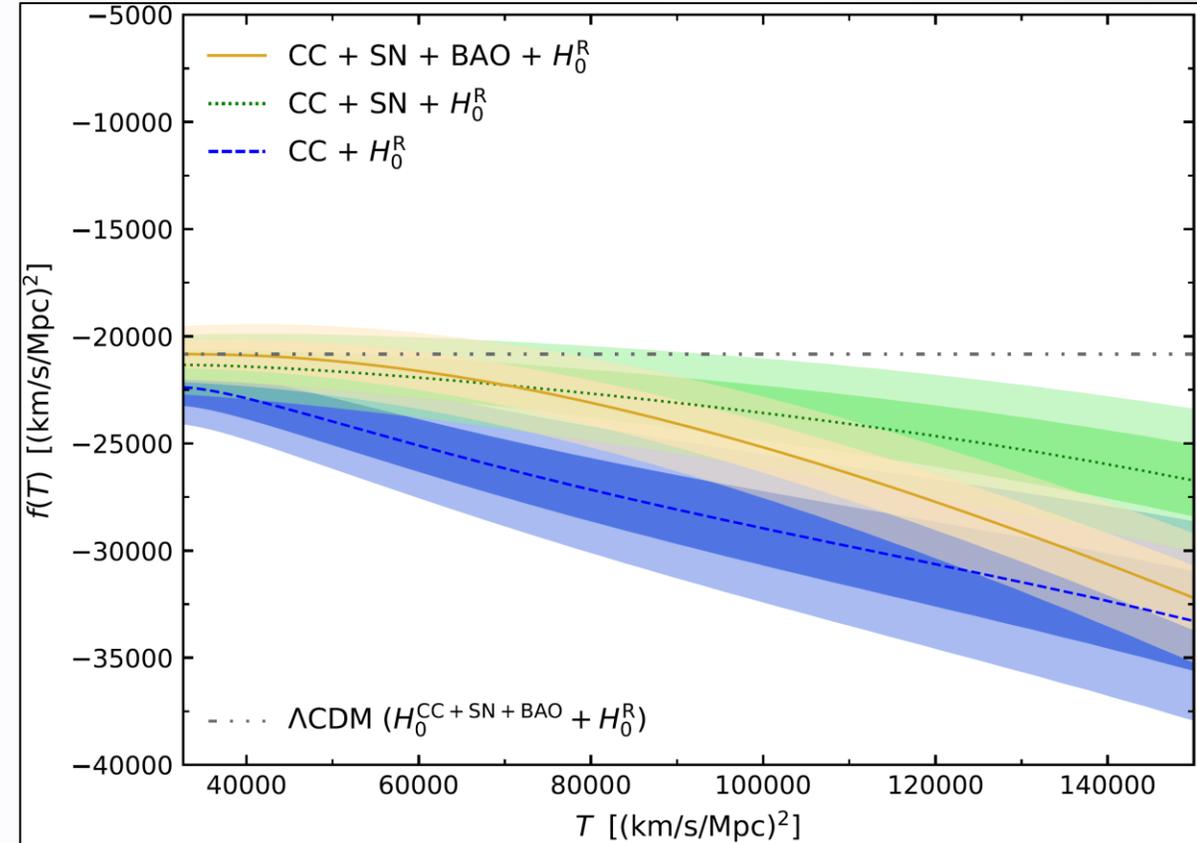

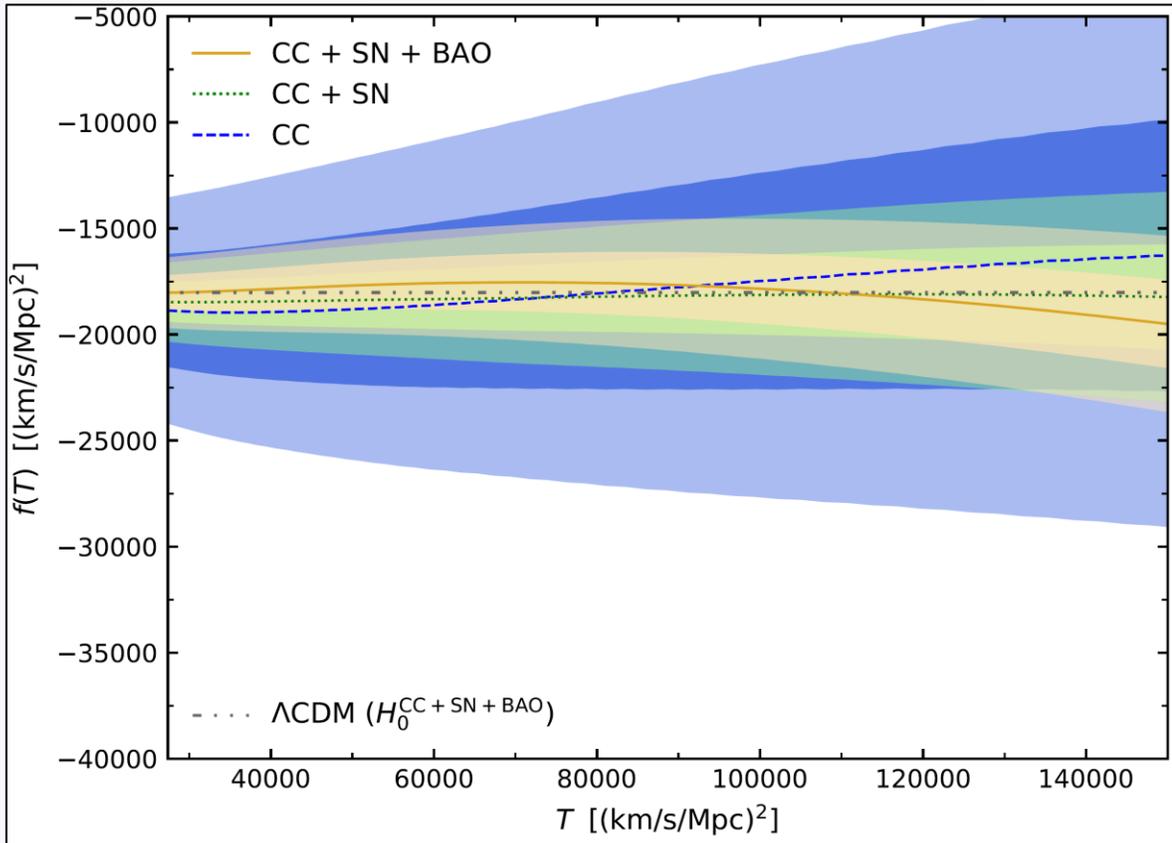

$$H^2 = \frac{8\pi G}{3} \rho_m - \frac{f(T)}{6} + \frac{T}{3} f_T$$

- This then gives a **propagation equation**

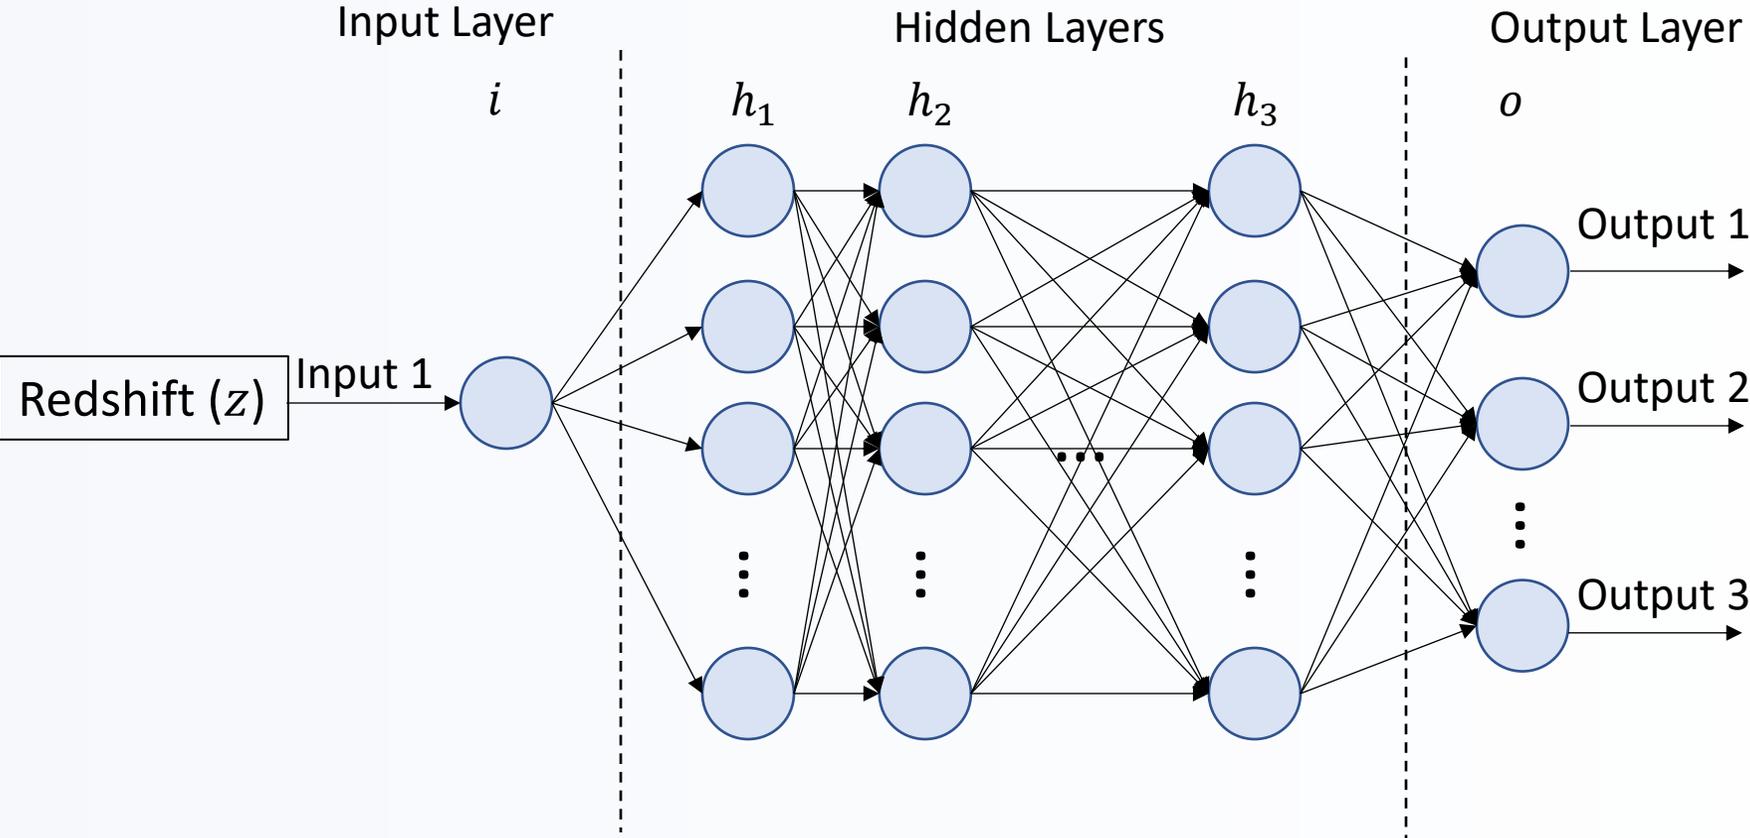

$$f(z_{i+1}) = f(z_{i-1}) + 2(z_{i+1} - z_{i-1}) \frac{H'(z_i)}{H(z_i)} \left( 3H(z_i)^2 + \frac{f(z_i)}{2} - 3H_0^2 \Omega_{m_0} (1 + z_i)^3 \right)$$

- Using **forward differencing**, we can produce a second boundary condition

# Square Exponential $f(T)$ GP

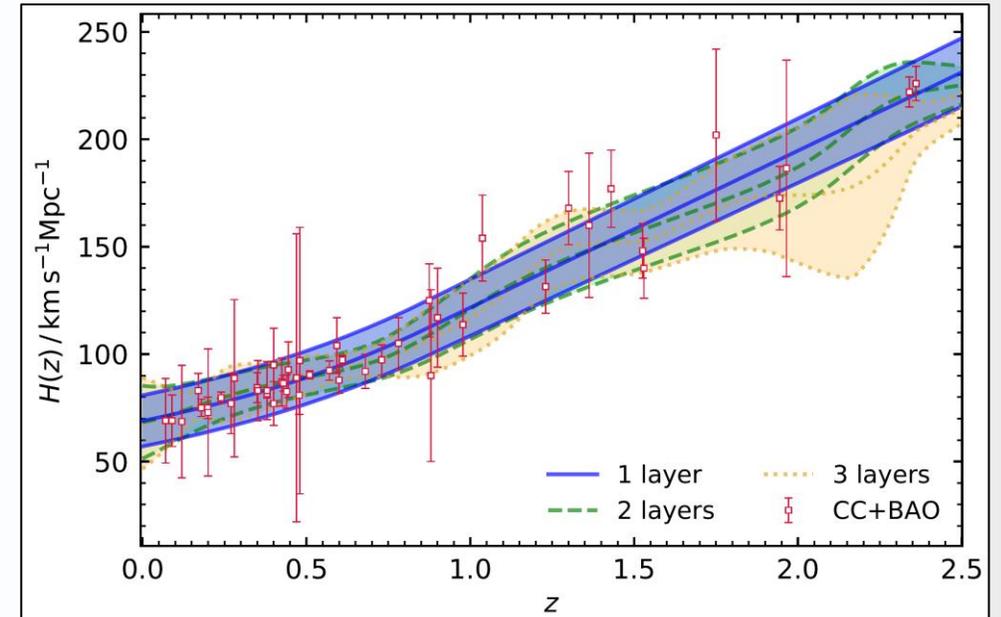

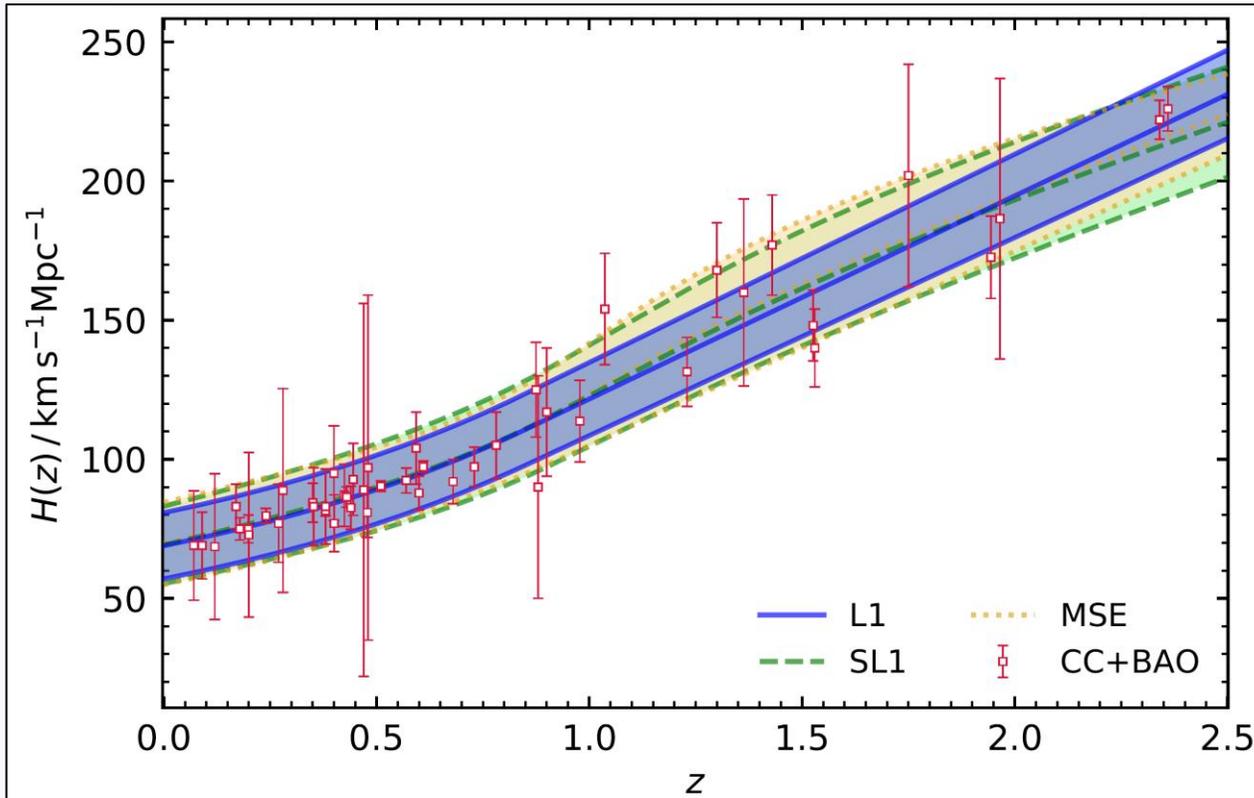

# Artificial Neural Networks (ANNs)

Cosmological parameters  
(ex.  $H(z)$ ,  $\sigma_H(z)$ )

# Using the ANN

**One layer is preferred**

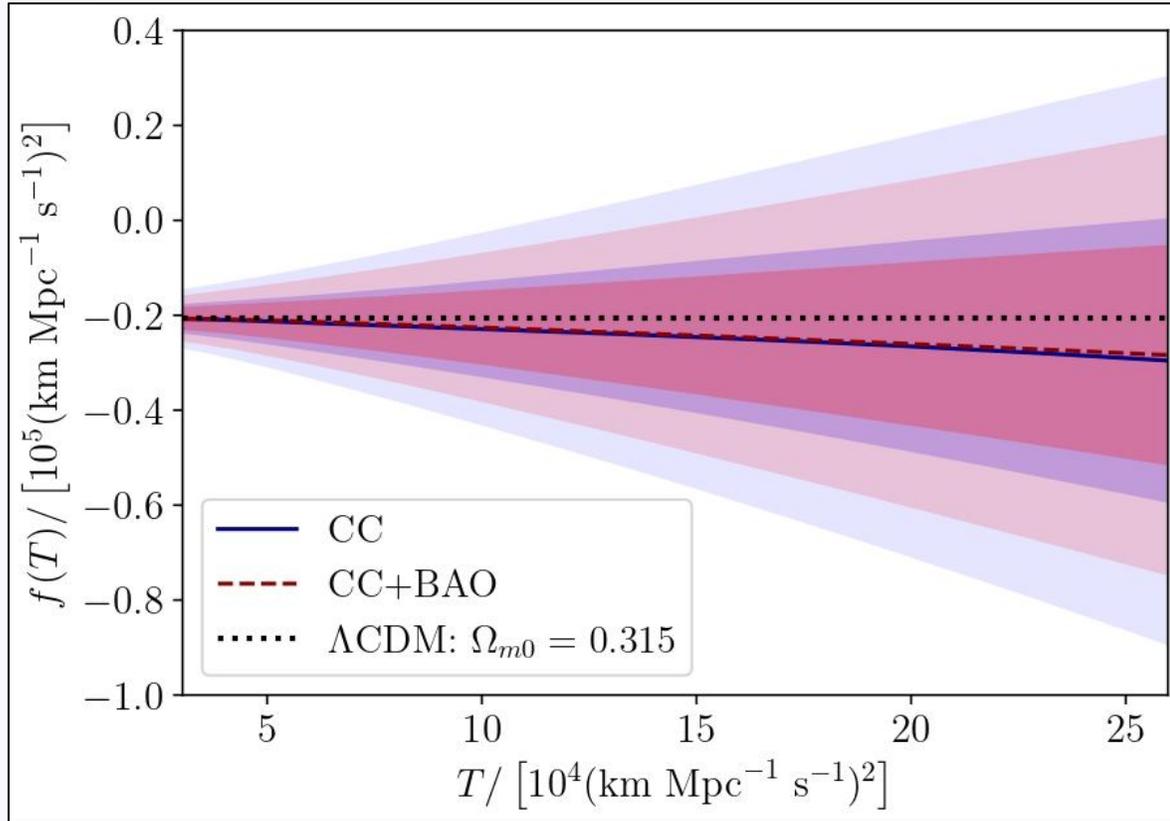

**MSE:**  $H_0 = 69.76 \pm 14.82 \text{ km s}^{-1} \text{Mpc}^{-1}$

**L1:**  $H_0 = 68.93 \pm 11.90 \text{ km s}^{-1} \text{Mpc}^{-1}$

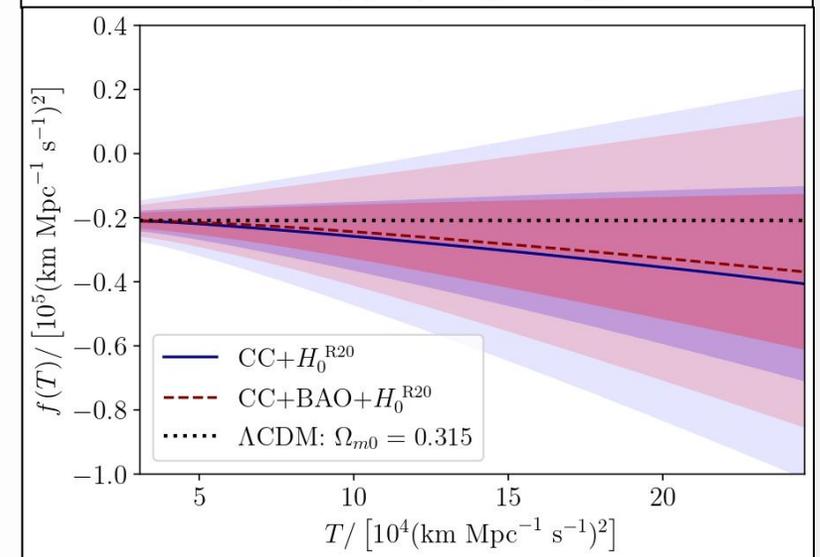

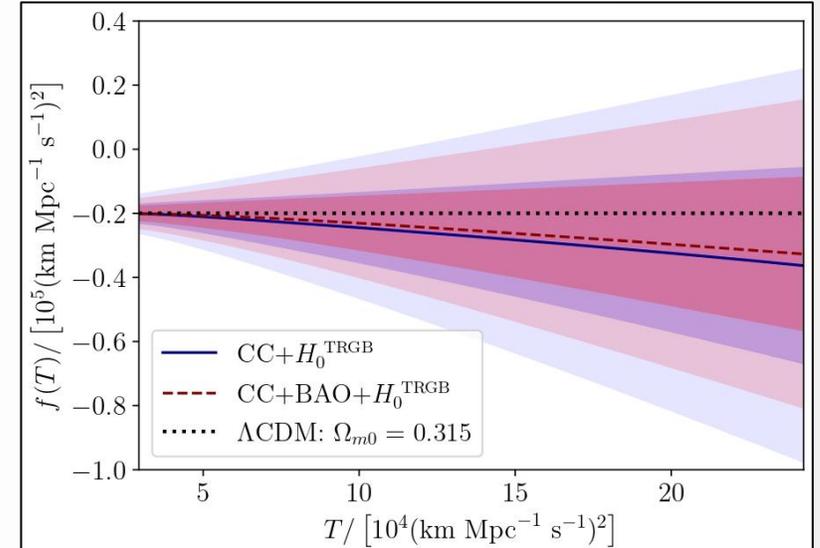

**SL1:**  $H_0 = 69.18 \pm 13.92 \text{ km s}^{-1} \text{Mpc}^{-1}$

# Propagating $f(T)$ CDM

$$H^2 = \frac{8\pi G}{3} \rho_m - \frac{f(T)}{6} + \frac{T}{3} f_T$$

# Horndeski Gravity

**Horndeski Gravity**: Produces the most **general second-order theory** that contains only **one scalar field** (in **standard gravity**)

$$S = \frac{1}{16\pi G} \int d^4x \sqrt{-g} [\mathcal{L}_2 + \mathcal{L}_3 + \mathcal{L}_4 + \mathcal{L}_5]$$

where

$$\mathcal{L}_2 = G_2(\phi, X)$$

$$\mathcal{L}_3 = G_3(\phi, X) \square \phi$$

$$\mathcal{L}_4 = G_4(\phi, X) R + G_{4,X}(\phi, X) [(\square \phi)^2 - \phi_{;\mu\nu} \phi^{;\mu\nu}]$$

$$\mathcal{L}_5 = G_5(\phi, X) G_{\mu\nu} \phi^{;\mu\nu} - \frac{1}{6} G_{5,X}(\phi, X) [(\square \phi)^3 + 2\phi_{;\mu}{}^\nu \phi_{;\nu}{}^\alpha \phi_{;\alpha}{}^\mu - 3\phi_{;\mu\nu} \phi^{;\mu\nu} \square \phi]$$

# Example classes of models

## Quintessence models

$$G_2 = X - V(\phi), G_3 = C, \\ G_4 = 1/2, G_5 = 0$$

Background equations:

$$3H^2 = \rho + \frac{\dot{\phi}^2}{2} + V(\phi)$$

$$2\dot{H} + 3H^2 = -p - \frac{\dot{\phi}^2}{2} + V(\phi)$$

$$\ddot{\phi} + 3H\dot{\phi} + V'(\phi) = 0$$

Equation of State parameter:

$$w_\phi = \frac{\dot{\phi}/2 - V}{\dot{\phi}/2 + V}$$

## Designer Horndeski models

$$G_2 = K(X), G_3 = G(X), \\ G_4 = 1/2, G_5 = 0$$

Background equations:

$$3H^2 = \rho - K(X) + 2XK_X + 3H\dot{\phi}^2 G_X \\ 2\dot{H} + 3H^2 = -p - K(X) + 2X\ddot{\phi}G_X$$

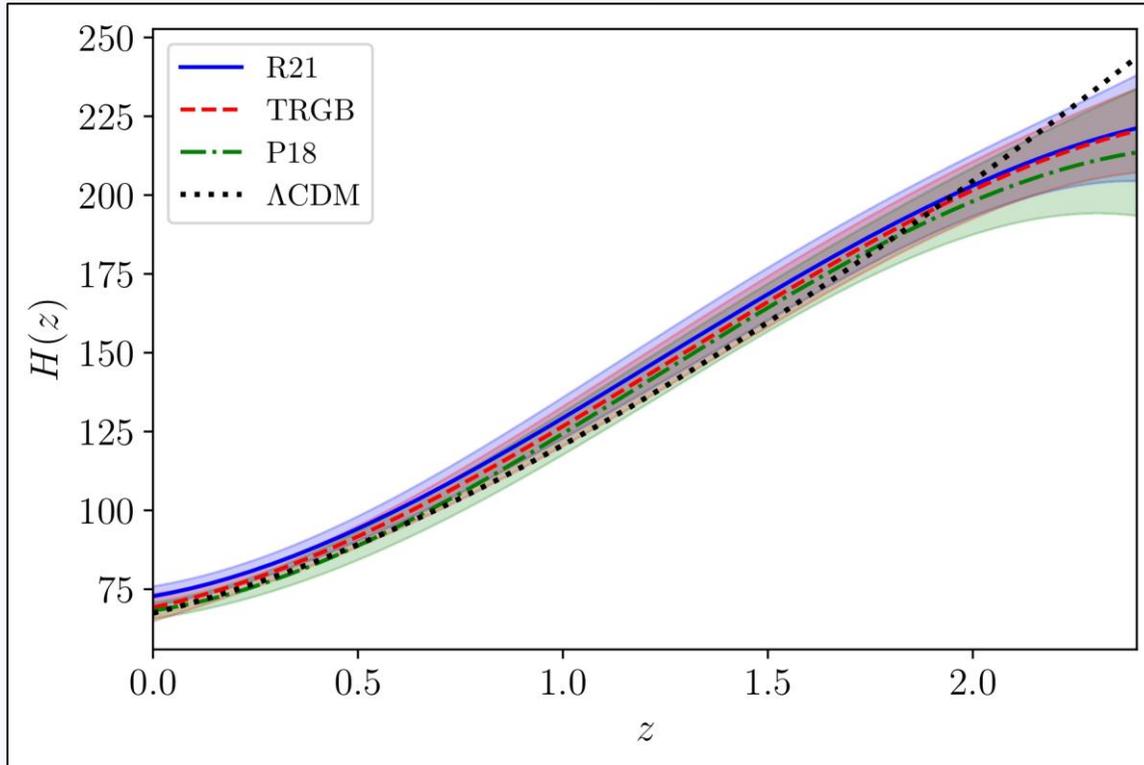

$$\ddot{\phi}[\dot{\phi}(3H(G_{XX}\dot{\phi}^2 + G_X) + K_{XX}\dot{\phi}) + K_X] \\ + 3\dot{\phi}(G_X\dot{H}\dot{\phi} + 3G_XH^2\dot{\phi} + HK_X) = 0$$

Equation of State parameter:

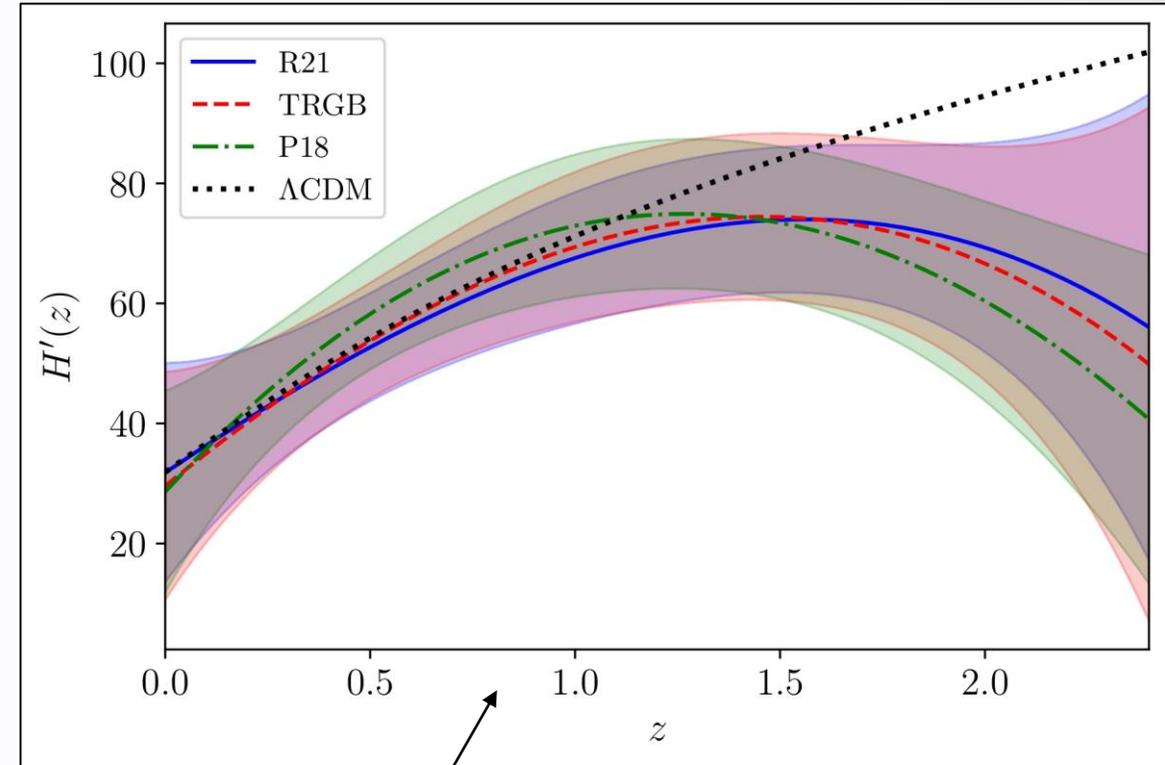

$$w_\phi = -1 + \frac{J\sqrt{2X}(H^2 - H_0^2(1 - \Omega_m))}{3H_0^4\Omega_m(1 - \Omega_m)} - \frac{2J\sqrt{2X}(\dot{\phi}K_X + 3H\dot{\phi}^2G_X)(1+z)HH'}{9H_0^4\Omega_m(1 - \Omega_m)}$$

where  $J = \dot{\phi}K_X + 3H\dot{\phi}^2G_X$

# Using the ANN

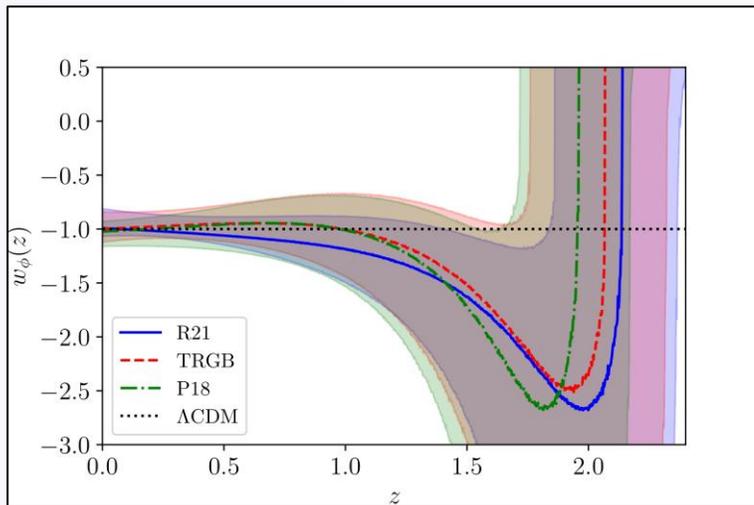

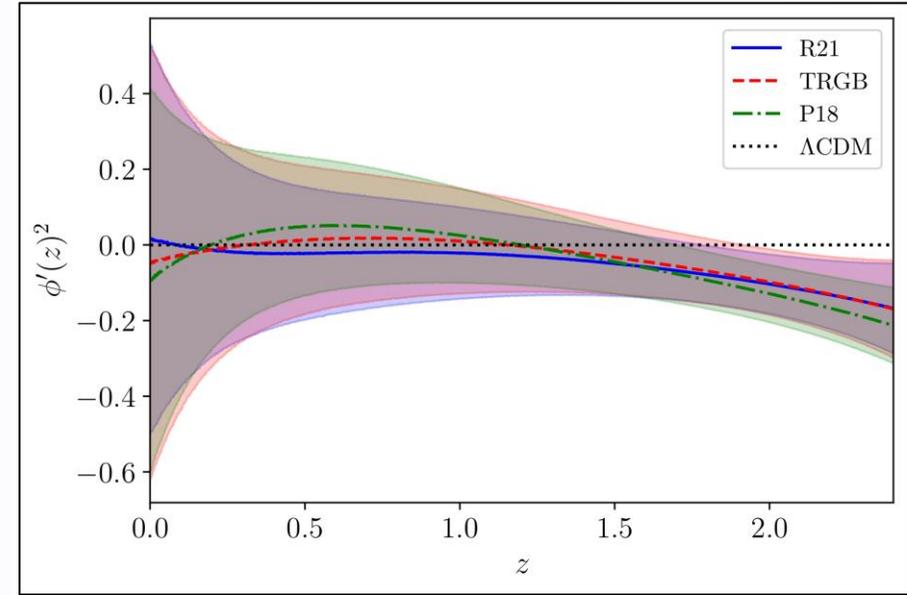

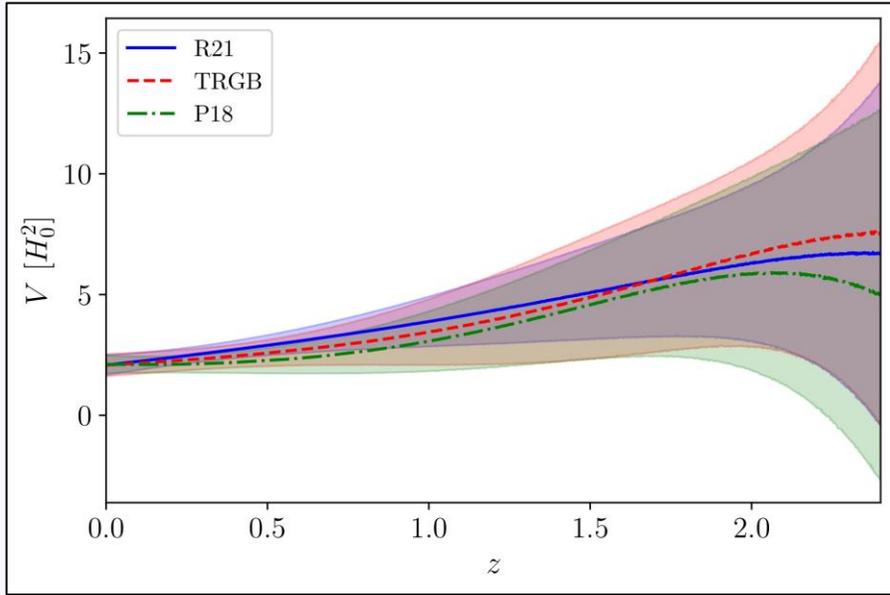

One layer is preferred

Monte Carlo routine used to determine uncertainties on  $H'(z)$

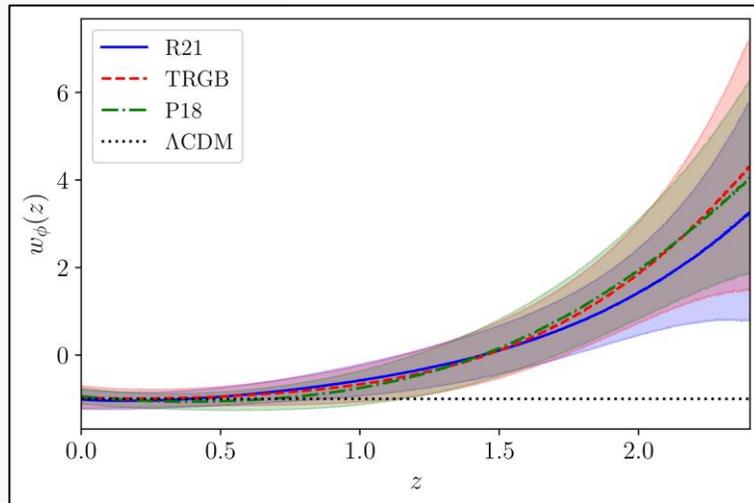

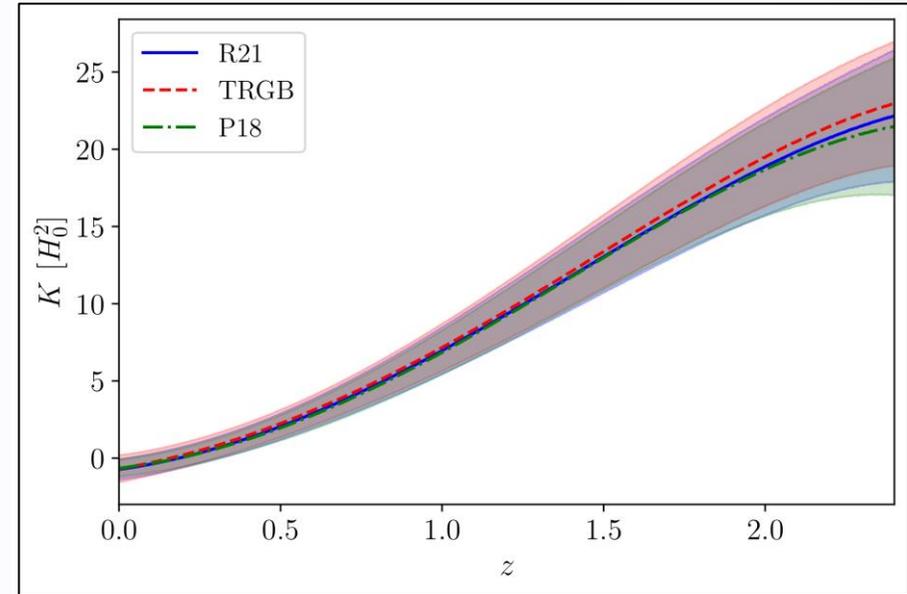

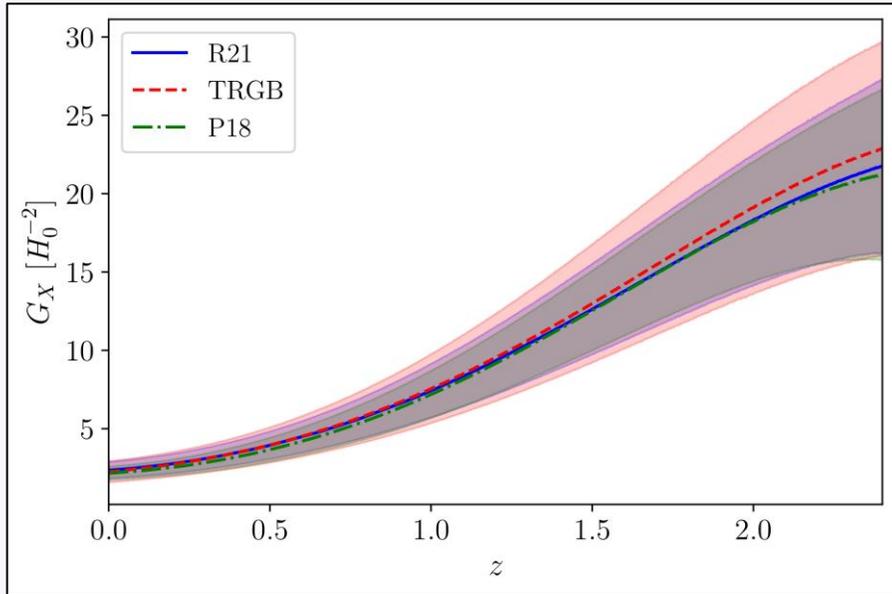

# Quintessence Models

$$V(\phi) = \dot{H} + 3H^2 - \frac{\rho - p}{2}$$

$$\dot{\phi}^2 = -2\dot{H} - (\rho - p)$$

# Designer Horndeski Models

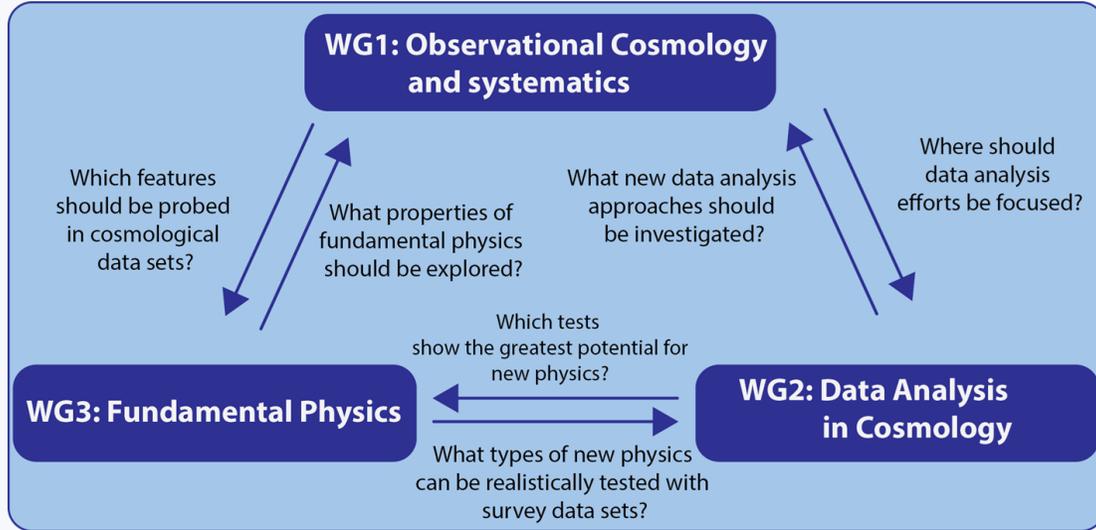

$$K = -3H_0^2(1 - \Omega_m) + \frac{J\sqrt{2X}H^2}{3H_0^2\Omega_m} - \frac{J\sqrt{2X}(1 - \Omega_m)}{\Omega_m}$$

$$G_X = -\frac{2JH'(X)}{3H_0^2\Omega_m}$$

Shajib, Anthony Walters, Anto Idicherian Lonappan et al. (438 additional authors not shown)

The standard model of cosmology has provided a good phenomenological description of a wide range of observations both at astrophysical and cosmological scales for several decades. This concordance model is constructed by a universal cosmological constant and supported by a matter sector described by the standard model of particle physics and a cold dark matter contribution, as well as very early-time inflationary physics, and underpinned by gravitation through general relativity. There have always been open questions about the soundness of the foundations of the standard model. However, recent years have shown that there may also be questions from the observational sector with the emergence of differences between certain cosmological probes. In this White Paper, we identify the key objectives that need to be addressed over the coming decade together with the core science projects that aim to meet these challenges. These discordances primarily rest on the divergence in the measurement of core cosmological parameters with varying levels of statistical confidence. These possible statistical tensions may be partially accounted for by systematics in various measurements or cosmological probes but there is also a growing indication of potential new physics beyond the standard model. After reviewing the principal probes used in the measurement of cosmological parameters, as well as potential systematics, we discuss the most promising array of potential new physics that may be observable in upcoming surveys. We also discuss the growing set of novel data analysis approaches that go beyond traditional methods to test physical models. [Abridged]

# Conclusion

---

- **Tensions in cosmology** is robustly established and unlikely to be due to cross-experiment systematics
- **Fundamental Physics** offers a variety of ways to address but more work is needed for the models to mature
- **Machine-learning inspired methods** (GP, GA & ANN) offer unique opportunities to probe new physics

# Thank You
