'Modern Methods in Quantum Gravity and Cosmology'

July 1-6, 2025, Bucharest-Magurele

# Challenge for a fundamental theory of Nature

#### describe both particle physics and cosmology

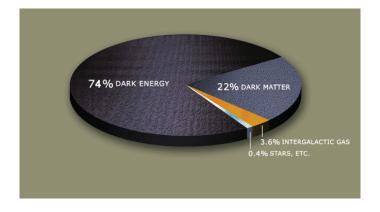

Accelerator experiments and cosmological observations: complementary information for the same fundamental theory

### Content of the Universe vs Standard Model

- Ordinary matter: only a tiny fraction  $\lesssim 5\%$
- Non-luminous (dark) matter:  $\sim 25\%$

Relativistic dark energy 70-75% of the observable universe

negative pressure:  $p = -\rho \implies$  cosmological constant

$$R_{ab} - rac{1}{2}Rg_{ab} + \Lambda g_{ab} = rac{8\pi G}{c^4}T_{ab} \ \Rightarrow \ 
ho_{\Lambda} = rac{c^4\Lambda}{8\pi G} = -p_{\Lambda}$$

Two length scales:

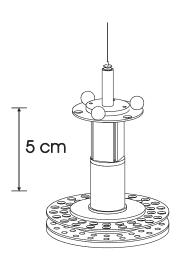

•  $[\Lambda] = L^{-2} \leftarrow \text{size of the observable Universe}$ 

$$\Lambda_{obs} \simeq 0.74 \times 3 H_0^2/c^2 \simeq 1.4 \times (10^{26} \, \mathrm{m})^{-2}$$
 Hubble parameter  $\simeq 73 \, \mathrm{km \, s^{-1} \, Mpc^{-1}}$ 

•  $\left[\frac{\Lambda}{G} \times \frac{c^3}{\hbar}\right] = L^{-4} \leftarrow \text{dark energy length} \simeq 85 \mu \text{m}$ 

#### Newton's law is valid down to distances 30 $\mu \mathrm{m}$

Adelberger et al. '06

# **Strings and extra dimensions**

- consistency of the theory  $\Rightarrow$  extra dimensions string coupling  $g_s$  can be treated as en extra dimension in M-theory
- matter and gauge interactions may be localized on lower dim branes transverse dimensions can be large [10]
- $\Rightarrow$  string scale  $M_s$  can be lower than the 4d Planck mass!
- opening a new way to address physics problems and scales
  - $M_s$  low (multi-TeV)  $\Rightarrow$  electroweak hierarchy
  - $\textit{M}_{\textit{s}}$  at intermediate energies  $\sim 10^{11}$  GeV  $\left(\textit{M}_{\textit{s}}^2/\textit{M}_{\textit{P}} \sim \, \text{TeV}\right)$
  - ⇒ SUSY breaking, strong CP axion, see-saw neutrino scale
  - ullet compactification  $\Rightarrow$  parameters: moduli fields + discrete fluxes
  - moduli stabilization ⇒ huge landscape of vacua [11]
    - ⇒ need an extra input of guidance principle

#### how they escape observation?

finite size R

energy cost to send a signal:

$$E > R^{-1} \leftarrow$$
 compactification scale

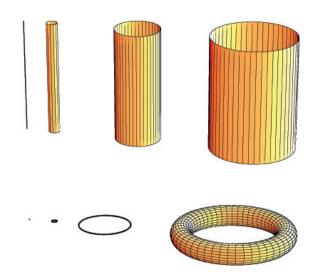

#### experimental limits on their size

light signal 
$$\Rightarrow E \gtrsim 1 \text{ TeV}$$
 
$$R \lesssim 10^{-16} \text{ cm}$$

#### how to detect their existence?

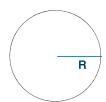

motion in the internal space ⇒ mass spectrum in 3d

### Dimensions D=??

example: - one internal circular dimension

- light signal

plane waves  $e^{ipy}$  periodic under  $y \rightarrow y + 2\pi R$ 

 $\Rightarrow$  quantization of internal momenta:  $p = \frac{n}{R}$ ;  $n = 0, \pm 1, \pm 2, ...$ 

 $\Rightarrow$  3d: tower of Kaluza Klein particles with masses  $M_n = |n|/R$ 

$$p_0^2 - \vec{p}^2 - p_5^2 = 0 \implies p^2 = p_5^2 = \frac{n^2}{R^2}$$

 $E >> R^{-1}$ : emission of many massive photons

⇔ propagation in the internal space [6]

### Our universe on a membrane

Two types of new dimensions:

• longitudinal: along the membrane

• transverse: "hidden" dimensions

only gravitational signal  $\, \Rightarrow R_{\perp} \lesssim 0.1$  mm !

Not all effective field theories can consistently coupled to gravity

- anomaly cancellation is not sufficient
- consistent ultraviolet completion can bring non-trivial constraints

those which do not, form the 'swampland'

criteria ⇒ conjectures

supported by arguments based on string theory and black-hole physics

Some well established examples:

- No exact global symmetries in Nature
- Weak Gravity Conjecture: gravity is the weakest force
  - $\Rightarrow$  minimal non-trivial charge:  $q \ge m$  in Planck units  $8\pi G = \kappa^2 = 1$

Arkani-Hamed, Motl, Nicolis, Vafa '06

# Distance/duality conjecture

At large distance in field space  $\phi \Rightarrow$  tower of exponentially light states  $m \sim \mathrm{e}^{-\alpha\phi}$  with  $\alpha \sim \mathcal{O}(1)$  parameter in Planck units

• provides a weakly coupled dual description up to the species scale

$$M_* = M_P/\sqrt{N}$$

Dvali '07

- tower can be either
  - 1 a Kaluza-Klein tower (decompactification of d extra dimensions)

$$m \sim 1/R$$
,  $\phi = \ln R$ ;  $M_* = M_P^{(4+d)} = (m^d M_P^2)^{1/(d+2)}$ 

2 a tower of string excitations

$$N=(M_*R)^d$$

 $M_* = m \sim \text{the string scale} = g_s M_P$ ;  $\phi = -\ln g_s$ ,  $N = 1/g_s^2$ 

emergent string conjecture

Lee-Lerche-Weigand '19

smallness of physical scales: large distance corner of landscape?

#### Theorem:

assuming a light gravitino (or gaugino) present in the string spectrum

$$M_{3/2} << M_P$$

 $\Rightarrow \exists$  a tower of states with the same quantum numbers and masses

$$M_k = (2Nk+1)M_{3/2}$$
;  $k = 1, 2, \dots$ ;  $N$  integer (not too large)

#### **Proof:**

- 2D free-fermionic constructions  $\Rightarrow N \lesssim 10$
- 2D bosonic lattices  $\Rightarrow N \lesssim 10^3$
- $\Rightarrow$  compactification scale  $m = \lambda_{3/2}^{-1} M_{3/2}$  with  $\lambda_{3/2} = 1/2N$ 
  - ⇒ large extra dimension at the TeV scale I.A. '90

# Dark dimension proposal for the dark energy

$$m=\lambda^{-1}\Lambda^{a} \quad (M_{P}=1) \quad ; \quad 1/4 \leq a \leq 1/2 \quad \mbox{ Montero-Vafa-Valenzuela '22}$$

• distance  $\phi = -\ln \Lambda$ 

- Lust-Palti-Vafa '19
- ullet  $a \leq 1/2$ : unitarity bound  $m_{
  m spin-2}^2 \geq 2H^2 \sim \Lambda$  Higuchi '87
- $a \ge 1/4$ : estimate of 1-loop contribution  $\Lambda \gtrsim m^4$

observations: 
$$\Lambda \sim 10^{-120}$$
 and  $m \gtrsim 0.01$  eV (Newton's law)  $\Rightarrow a = 1/4$  astro/cosmo constraints  $\Rightarrow d = 1^*$  'dark' dimension of  $\sim$  micron size species scale (5d Planck mass):  $M_* \simeq \lambda^{-1/3} \, 10^8$  GeV  $10^{-4} \lesssim \lambda \lesssim 10^{-1}$  \*also  $d = 2$  with  $M_* \sim 10$  TeV Anchordogui-l.A.-Lust '25

Our observable universe should be localised on a '3-brane'  $\perp$  to the DD I.A.-Arkani Hamed-Dimopoulos-Dvali '98

## Physics implications of the dark dimension

See Review article 2405.04427 Anchordoqui-I.A.-Lust

### **Neutrino** masses

• natural explanation of neutrino masses introducing  $\nu_R$  in the bulk  $\nu$ -oscillation data with 3 bulk neutrinos  $\Rightarrow m \gtrsim 2.5 \text{ eV}$  ( $R \lesssim 0.4 \,\mu\text{m}$ )  $\Rightarrow \lambda \lesssim 10^{-3}$  and  $M_* \sim 10^9$  GeV the bound can be relaxed in the presence of bulk  $\nu_R$ -neutrino masses Lukas-Ramond-Romanino-Ross '00, Carena-Li-Machado<sup>2</sup>-Wagner '17

 support on Dirac neutrinos by the sharpened WGC non-SUSY AdS vacua (flux supported) are unstable Ooguri-Vafa '16 avoid 3d AdS vacuum of the Standard Model with Majorana neutrinos Arkani-Hamed, Dubovsky, Nicolis, Villadoro '07

lightest Dirac neutrino  $\lesssim$  few eV or light gravitino  $\mathcal{O}(\text{meV})$ Ibanez-Martin Lozano-Valenzuela '17; Anchordoqui-I.A.-Cunat '23

### Dark matter candidates

- 2 main new DM candidates:
  - 5D primordial black holes in the mass range  $10^{15}-10^{21} {\rm g}^{\star}$  with Schwarzschild radius in the range  $10^{-4}-10^{-2}~\mu{\rm m}$

Anchordoqui-I.A.-Lust '22

2 KK-gravitons of decreasing mass due to internal decays (dynamical DM)

from  $\sim$  MeV at matter/radiation equality (  $T \sim$  eV) to  $\sim$  50 keV today

Gonzalo-Montero-Obied-Vafa '22

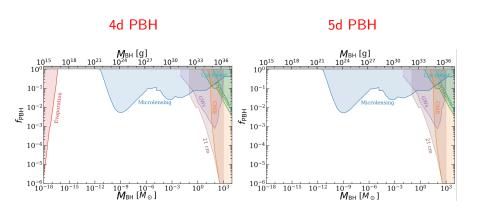

possible equivalence between the two

Anchordoqui-I.A.-Lust '22

\* 
$$10^8 - 10^{21}$$
g for 6D

Anchordoqui-I.A.-Lust '25

### Primordial Black Holes as Dark Matter

5D BHs live longer than 4D BHs of the same mass

### Dark Dimension Radion stabilization and inflation

If 4d inflation occurs with fixed DD radius ⇒ too low inflation scale

Higuchi bound:  $H_I \lesssim m \sim \text{eV}$ 

Interesting possibility: the extra dimension expands with time

 $R_0 \sim 1/M_*$  to  $R \sim \mu \text{m}$  requires  $\sim$  40 efolds! Anchordoqui-I.A.-Lust '22

$$ds_5^2 = a_5^2(-d\tau^2 + d\vec{x}^2 + R_0^2 dy^2)$$
  $R_0$ : initial size prior to inflation 
$$= \frac{ds_4^2}{R} + R^2 dy^2 \; ; \quad ds_4^2 = a^2(-d\tau^2 + d\vec{x}^2) \; \Rightarrow \; a^2 = R^3$$

After 5d inflation of N=40-efolds  $\Rightarrow 60$  e-folds in 4d with  $a=e^{3N/2}$ 

Large extra dimensions from inflation in higher dimensions

Anchordogui-IA '23

# Large hierarchies in particle physics and cosmology

Particle physics: why gravity appears so weak compared to other forces?

$$M_p/M_w\sim 10^{16}$$

Cosmology: why the Universe is so large compared to our causal horizon?

at least  $10^{26}$  larger

Question: can uniform (4 + d) inflation relate the 2 hierarchies?

size of the observable universe to the observed weakness of gravity

compared to the fundamental (gravity/string) scale  $M_{st}$ 

Extra dimensions should expand from the fundamental length

to the size required for the present strength of gravity

while at the same time the horizon problem is solved in our universe

Answer: yes for any d [22]

$$ds_{4+d}^2 = \left(\frac{r}{R}\right)^d ds_4^2 + R^2 dy^2 ; ds_4^2 = a^2(\tau)(-d\tau^2 + d\vec{x}^2)$$
  
=  $\hat{a}_{4+d}^2(\tau)(-d\tau^2 + d\vec{x}^2 + R_0^2) r \equiv \langle R \rangle_{\text{end of inflation}}$ 

- exponential expansion in higher-dims  $\Rightarrow$  power low inflation in 4D FRW coordinates:  $e^{H\hat{t}} \sim (Ht)^{2/d} \Rightarrow R(t) \sim t^{2/d}$ ,  $a(t) \sim t^{1+2/d}$
- $\hat{N}$  e-folds in (4+d)-dims  $\Rightarrow N = (1+d/2)\hat{N}$  e-folds in 4D

Impose 
$$M_*=M_p e^{-dN/(2+d)}\gtrsim 10$$
 TeV 
$$\gtrsim 10^8 \ {\rm GeV} \ {\rm for} \ d=1 \ (r\lesssim 30\mu{\rm m})$$

 $\Rightarrow$  the horizon problem is solved for any d  $N \gtrsim 30-60$  ( $N \gtrsim \ln \frac{M_l}{\mathrm{eV}}$ )

### Precision of CMB power spectrum measurement

Physical distances change from higher to 4 dims

equal time distance between two points in 3-space

$$d_{\rm phys}^{\tau}(x,x') = d(x,x') \, a(\tau) = d(x,x') \, \hat{a}(\tau) \left(\frac{R}{R_0}\right)^{d/2} = \hat{d}_{\rm phys}^{\tau}(x,x') \frac{M_p(\tau)}{M_*}$$
 co-moving distance

precision of CMB data: angles  $\lesssim$  10 degrees, distances  $\lesssim$  Mpc (Gpc today)

 $\mathsf{Mpc} \to \mathsf{Mkm}$  at  $M_I \sim \mathsf{TeV}$  with radiation dominated expansion

$$\times \text{TeV}/M_I$$
 at a higher inflation scale  $M_I \sim M_* \ \times M_*/M_P$  conversion to higher-dim distances  $\times \text{TeV}/M_P$ 

 $\simeq$  micron scale!

d > 2: needs a period of 4D inflation for generating scale invariant density perturbations

### Density perturbations from 5D inflation

inflaton (during inflation)  $\simeq$  massless minimally coupled scalar in dS space

 $\Rightarrow$  logarithmic growth at large distances (compared to the horizon  $H^{-1}$ ) equal time 2-point function in momentum space at late cosmic time

$$\langle \Phi^2(\hat{k}, \tau) \rangle_{\tau \to 0} \simeq \frac{4}{\pi} \frac{H^3}{(\hat{k}^2)^2} \quad ; \quad \hat{k}^2 = k^2 + n^2/R^2$$

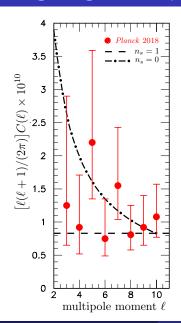

2-point function on the Standard Model brane (located at y = 0):

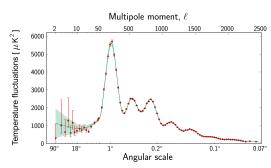

$$\sum_{n} \langle \Phi^{2}(\hat{k}, \tau) \rangle_{\tau \to 0} \simeq \frac{2RH^{3}}{k^{2}} \left( \frac{1}{k} \coth(\pi kR) + \frac{\pi R}{\sinh^{2}(\pi kR)} \right) ; \quad k = 2\pi/\lambda$$

Amplitude of the power spectrum:  $\mathcal{A}=\frac{k^3}{2\pi^2}\langle\Phi^2(k,\tau)\rangle_{y=0}$ 

- $\pi kR > 1$  ('small' wave lengths)  $\Rightarrow A \sim \frac{H^2}{\pi^2}$   $n_s \simeq 1$  summation over n crucial for scale invariance: 'tower' of 4D inflatons
- $\pi kR < 1$  ('large' wave lengths)  $\Rightarrow \mathcal{A} \simeq \frac{2H^3}{\pi^3 k}$   $n_s \simeq 0$

## Large-angle CMB power spectrum

5D: inflaton + metric (5 gauge invariant modes)  $\Rightarrow$ 

4D: 2 scalar modes (inflaton + radion), 2 tensor modes, 2 vector modes

$$\begin{array}{lll} \mathcal{P}_{\mathcal{R}} & \simeq & \frac{1}{3\varepsilon}\,\mathcal{A}\left[\left(\frac{k}{\hat{a}H}\right)^{2\delta-5\varepsilon} + \varepsilon\left(\frac{k}{\hat{a}H}\right)^{-3\varepsilon}\,\times \left\{\frac{\frac{5}{24}}{\frac{1}{3}} \, R_0 k >> 1\right.\right] \\ \mathcal{P}_{\mathcal{T}} & \simeq & \frac{4H^2}{\pi^2} \left(\frac{k}{\hat{a}H}\right)^{-3\varepsilon}\,\times \left\{\frac{R_0H}{\pi k} \, R_0 k >> 1 \right. \\ \mathcal{P}_{\mathcal{V}} & \simeq & \frac{4R_0H^3}{\pi^2} \left(\frac{k}{\hat{a}H}\right)^{-3\varepsilon}\,\times \left\{\frac{1}{\frac{\pi^3}{45}} \, R_0 k << 1\right. \\ \mathcal{P}_{\mathcal{S}} & \simeq & \frac{9\varepsilon^2}{16} \mathcal{P}_{\mathcal{R}} \quad \text{entropy} \\ \Rightarrow \beta_{\text{isocurvature}} = \frac{\mathcal{P}_{\mathcal{S}}}{\mathcal{P}_{\mathcal{R}} + \mathcal{P}_{\mathcal{S}}} \simeq \frac{9\varepsilon^2}{16} < 0.038 \, \text{exp} \\ \end{array}$$

I. Antoniadis (PhD School Bucharest 2025)

# Bispectrum from 5D inflation IA-Chatrabhuti-Cunat-Isono '25

$$f_{\mathsf{NL}} \underset{\substack{R_0 k_1 \ll 1 \\ R_0 k_2 \ll 1 \\ R_0 k_3 \ll 1}}{\overset{5}{\sim}} \frac{8}{12} \frac{8}{R_0^3 k_1 k_2 k_3} \left\{ (\varepsilon_2 - \varepsilon_1) \frac{k_1^4 + k_2^4 + k_3^4}{k_1^3 + k_2^3 + k_3^3} + 8\varepsilon_1 \frac{k_1^2 k_2^2 + k_1^2 k_3^2 + k_2^2 k_3^2}{k_1^3 + k_2^3 + k_3^3} \right\}$$

$$f_{\text{NL}} \underset{\substack{R_0 k_1 \ll 1 \\ R_0 k_2 \gg 1 \\ R_0 k_2 \gg 1}}{\overset{\sim}{\underset{R_0 k_2 \gg 1}{\sim}}} \frac{5}{12} \frac{2}{R_0 k_1} \left\{ (\varepsilon_2 - \varepsilon_1) + 16\varepsilon_1 \frac{k_2^2 k_3^2}{(k_2 + k_3)(k_2^3 + k_3^3)} \right\} \quad k_t =: \sum_a k_a$$

$$f_{\text{NL}} \underset{\substack{R_0 k_1 \gg 1 \\ R_0 k_2 \gg 1 \\ R_0 k_3 \gg 1}}{\overset{5}{12}} \left\{ \left( \varepsilon_2 - \varepsilon_1 \right) + \frac{16\varepsilon_1}{k_1^3 + k_2^3 + k_3^3} \underset{1 \leq a < b \leq 3}{\sum} \left( \frac{k_a^2 k_b^2}{k_t} + k_1 k_2 k_3 \frac{k_a k_b}{k_t^2} \right) \right\}$$

$$f_{\rm NL}^{\rm 4D} = \frac{5}{12} \left\{ (\varepsilon_2 - \varepsilon_1) + \frac{\varepsilon_1}{k_1^3 + k_2^3 + k_3^3} \sum_{1 \le a < b \le 3} \left( k_a k_b^2 + k_a^2 k_b + \frac{8}{k_t} k_a^2 k_b^2 \right) \right\}$$

 $f_{\rm NL}|_{R_0k_2\gg 1}\neq f_{\rm NL}^{\rm 4D}$ : global conformal invariance is broken

### **End of inflation**

Inflaton: 5D field  $\varphi$  with a coupling to the brane to produce SM matter

e.g. via a 'Yukawa' coupling suppressed by the bulk volume  $y\sim 1/(RM_*)^{1/2}$ 

Its decay to KK gravitons should be suppressed to ensure  $\Delta \textit{N}_{\rm eff} < 0.2$ 

$$\left(\Gamma_{\mathrm{SM}}^{\varphi} \sim \frac{m}{M_{*}} m_{\varphi}\right) > \left(\Gamma_{\mathrm{grav}}^{\varphi} \sim \frac{m_{\varphi}^{4}}{M_{*}^{3}}\right) \Rightarrow m_{\varphi} < 1 \,\mathrm{TeV}$$

5D cosmological constant at the minimum of the inflaton potential

⇒ runaway radion potential:

$$V_0 \sim \frac{\Lambda_5^{
m min}}{R}$$
;  $(\Lambda_5^{
m min})^{1/5} \lesssim 100 \, {
m GeV}$  (Higuchi bound)

canonically normalised radion:  $\phi = \sqrt{3/2} \ln(R/r)$   $r \equiv \langle R \rangle_{\rm end~of~inflation}$ 

 $\Rightarrow$  exponential quintessence-like form  $V_0 \sim e^{-\alpha\phi}$  with  $\alpha \simeq 0.8$ 

just at the allowed upper bound: Barreiro-Copeland-Nunes '00

### Radion stabilisation at the end of 5D inflation

Anchordoqui-IA '23

Potential contributions stabilising the radion:

$$V = \left(\frac{r}{R}\right)^2 \hat{V} + V_C$$
 ;  $\hat{V} = 2\pi R \Lambda_5^{\min} + T_4 + 2\pi \frac{K}{R}$ 

 $T_4$ : 3-branes tension, K: kinetic gradients,  $V_C$ : Casimir energy  $\uparrow$ Arkani-Hamed, Hall, Tucker-Smith, Weiner '99

Radion mass  $m_R$ :  $\sim$  eV  $(m_{KK})$  to  $10^{-30}$  eV  $(m_{KK}^2/M_p)$  depending on K

- $K \sim M_*$ , all 3 terms of  $\hat{V}$  of the same order,  $V_C$  negligible tune  $\Lambda_4 \sim 0_+ \Rightarrow m_R \lesssim m_{KK} \sim \text{eV}$
- K negligible, all 3 remaining terms of the same order

$$\Rightarrow$$
 minimum is driven by a +ve  $V_C = \frac{2\pi r^2}{32\pi^7 R^6} (N_F - N_B)$ 

Arkani-Hamed, Dubovsky, Nicolis, Villadoro '07

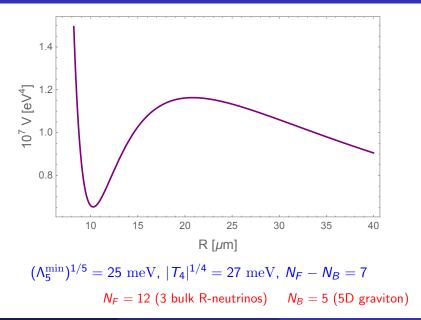

no tuning of  $\Lambda_4$  but  $\Lambda_5^{\min}$  should be order (subeV)<sup>5</sup> [30]

# Casimir potential

$$V_C = 2\pi R \left(\frac{r}{R}\right)^2 \text{Tr}(-)^F \rho(R, m)$$
  $m: 5D$  mass

$$\rho(R, m) = -\sum_{n=1}^{\infty} \frac{2m^5}{(2\pi)^{5/2}} \frac{K_{5/2}(2\pi Rmn)}{(2\pi Rmn)^{5/2}} \begin{cases} mR \to \infty & \text{exp suppressed} \\ mR \to 0 & 1/R^5 \end{cases}$$

# **Example of Radion stabilisation potential**

## Cosmic discrepancies and Hubble tension

Anchordoqui-I.A.-Lust '23, AAL-Noble-Soriano '24

 $5\sigma$  tension between global and local measurements

$$H_0 = 67.4 \pm 0.5 \text{ km/s/Mpc}$$
 Planck data

$$H_0 = 73.04 \pm 1.04 \text{ km/s/Mpc}$$
 SH0ES supernova

This tension can be resolved if  $\Lambda$  changes sign around redshift  $z \simeq 2$ 

Akarsu-Barrow-Escamilla-Vasquez '20, AV-Di Valentino-Kumar-Nunez-Vazquez '23

 $AdS \rightarrow dS$  transition is hard to implement due to a swampland conjecture:

non-SUSY AdS vacua are at infinite distance in moduli space

However it could happen due to quantum tunnelling

false vacuum decay of 5D scalar

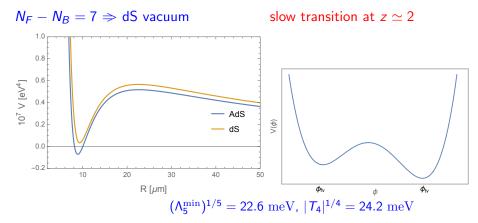

Anchordoqui-I.A.-Lüst '23, Anchordoqui-I.A.-Lüst-Noble-Soriano

## 

5D scalar at a false vacuum with light mass (lighter than  $R_{\text{max}}^{-1}$ )

$$N_F - N_B = 6 \Rightarrow AdS$$
 vacuum

decay to a (almost degenerate  $\delta\epsilon<\Lambda$ ) true vacuum with heavy mass

### **Conclusions**

smallness of some physical parameters might signal

a large distance corner in the string landscape of vacua
such parameters can be the scales of dark energy and SUSY breaking
mesoscopic dark dimension proposal: interesting phenomenology
neutrino masses, dark matter, cosmology, SUSY breaking
Large extra dimensions from higher dim inflation

- connect the weakness of gravity to the size of the observable universe
- scale invariant density fluctuations from 5D inflation
- radion stabilization
